S. C. STATE LIBRARY

1965 TOBACCO SEASON

South Carolina's 1965 tobacco season, which opened on Thursday, August 5, closed on Tuesday, October 5, with the state's tobacco producers receiving $80,588,354.71 for 122,820,507 pounds of tobacco offered for sale.

Producers received an average price of 65.6 cents per pound for their tobacco, and this 1965 average price was 5.1 cents per pound higher than the 60.5 cents paid producers in 1964.

In 1964, a total of 143,483,632 pounds of tobacco was sold for $86,779,666.92.

Preliminary estimates indicate that during 1965, South Carolina tobacco producers harvested 143,550,000 pounds of tobacco from a planted acreage of 66,000 acres at an average yield of 2,175 pounds per acre.

In 1965, flue cured tobacco acreage was planted under an acreage-poundage control system. This system of controlling tobacco production was approved by tobacco producers in a special referendum held in May, 1965.

In a referendum held on December 15, 1964, flue-cured tobacco producers in Alabama, Florida, Georgia, North Carolina, South Carolina, and Virginia had already approved a national marketing quota for the 1965, 1966, and 1967 tobacco crops in addition to a 19.5 per cent acreage reduction from the 1964 planted acreage.

Prior to the referendum held on December 15, 1964, there had been some talk among leading tobacco producers, companies, and United States Department of Agriculture officials about trying to bring surplus tobacco supplies in line with demand through an acreage-poundage control system.

During the early part of 1965, sentiment and pressure began building so strongly in favor of trying the acreage-poundage system that Secretary of Agriculture Orville L. Freeman called a special referendum to determine if the majority of flue-cured tobacco growers were in favor of trying such a system of production controls.

Although not all tobacco leaders were in favor of such a system, tobacco growers did turn in a majority vote to give the system a try.

The average price paid for tobacco in South Carolina in 1965 was 65.6 cents per pound which was considerably higher than

the 60.5 cents per pound paid in 1964. While 1965's average price per pound is much higher than 1964's average price, it is still too early to ascertain if this was due to the acreage-poundage system or to an unexpected increase in demand.

The 1965 average is the second highest price ever received by producers. The record average which occurred in 1961, stands at 66.2 cents per pound. In 1961, tobacco producers sold over 14 million more pounds of tobacco on South Carolina markets than was sold in 1965.

United States Department of Agriculture figures indicate that during the 1965 tobacco season South Carolina producers sold a total of 17,184,414 pounds of tobacco in Georgia, 12,-700,742 pounds in North Carolina, and 3,218 pounds in Virginia.

The above out-of-state sales were off-set by 15,378,438 pounds of North Carolina tobacco being sold in South Carolina, 204,845 pounds of Virginia tobacco being sold in the state, and 1,354 pounds of Alabama tobacco being sold in the state.

South Carolina ended up on the short end of importing and exporting of tobacco for sales purposes by a total of 14,041,744 pounds. This shortage can be attributed primarily to the fact that such a tremendous volume of South Carolina flue-cured tobacco was sold on Georgia's loose-leaf markets.

Following is a recap of South Carolina's 1965 tobacco season by months.

AUGUST LOOSE-LEAF SALES

South Carolina's forty tobacco warehouses opened for business for the 1965 tobacco season on Thursday, August 5. Tobacco was sold both loose-leaf and tied on that date and on the following six selling days with loose-leaf sales ending on Friday, August 13. Tied tobacco sales which remained in effect for the remainder of the 1965 selling season began on Monday, August 16.

Opening day found much higher average prices being paid for loose-leaf tobacco than had been paid in any year since loose-leaf sales were permitted on South Carolina tobacco markets. These high average prices for loose-leaf tobacco continued throughout the seven day loose-leaf selling period.

Following is a summary of loose-leaf sales during the seven day period of loose-leaf sales.

Date	*Pounds*	*Value*	*Average*
August 5, 1965	5,126,300	$3,185,413	62.14
August 6, 1965	2,546,432	1,550,229	60.88
August 9, 1965	4,786,812	3,035,471	63.41
August 10, 1965	2,377,654	1,479,520	62.23
August 11, 1965	2,803,024	1,758,697	62.74
August 12, 1965	3,775,636	2,339,608	61.96
August 13, 1965	3,044,736	1,838,333	60.38

Loose-leaf sales ended on Friday, August 13, with a total of 21,868,570 pounds of producer tobacco being sold for $13,630,731.12 at an average price of 62.33 cents per pound.

These 1965 loose-leaf sales compared with 1964, loose-leaf sales when 16,825,611 pounds of loose-leaf tobacco was sold for $8,385,462.27 at an average price of 49.83 cents per pound.

Growers received 12.49 cents more per pound for their loose-leaf tobacco in 1965, than in 1963.

AUGUST TIED TOBACCO SALES

Tied tobacco sales opened for the remainder of the 1965 Tobacco Season on Monday, August 16, 1965. Although 2,301,556 pounds of tied tobacco had been sold from opening day on August 5 through the close of loose-leaf sales on August 13, a total of 5,807,107 pounds of tied tobacco was offered for sale on August 16. This 5,807,107 pounds of tobacco brought $3,988,461.00 at an average price of 68.68 cents per pound.

The remainder of August tied sales was very consistent and fluctuated from a daily high average of 69.88 cents per pound paid for 7,837,876 pounds of tobacco sold on Monday, August 23, to a daily low average of 65.82 cents per pound paid for 5,383,395 pounds of tobacco offered for sale on Tuesday, August 31.

The average price paid for tied tobacco during August was 67.54 cents per pound which was an increase of 4.07 cents per pound over the 63.47 cents per pound paid in August, 1964.

Tied sales during August, 1965, totaled 59,648,551 pounds as compared to 59,278,996 pounds in August, 1964.

AUGUST TIED AND LOOSE SALES

Combined sales of tied and loose tobacco during August, 1965, totaled 81,517,121 pounds valued at $53,920,516.54 against

76,104,607 pounds of tobacco sold in August, 1964, with a value of $46,010,219.71.

The average price of 66.15 cents per pound paid for loose and tied tobacco during August, 1965, was 5.69 cents per pound more than the 60.46 cents per pound paid during August, 1964.

This higher average price paid during August, 1965, helped producers to receive $7,910,296.83 more than they received for their combined tobacco sales in August, 1964.

SEPTEMBER SALES

September tobacco sales opened on Wednesday, September 1, 1965, with an average price of 65.57 cents per pound being paid for 3,343,188 pounds of tobacco.

Following opening day sales for September, the highest price paid was 67.65 cents per pound for 7,439,659 pounds of tobacco on Tuesday, September 7, 1965.

The lowest price paid during September was on Thursday, September 30, 1965, when 54.96 cents per pound was paid for 759,175 pounds of tobacco.

Average price during September, 1965, amounted to 64.68 cents per pound paid for 40,705,071 pounds of tobacco as compared to 60.69 cents per pound paid in September, 1964. September, 1965's average price increased 3.99 cents per pound over September, 1964's average price.

Markets began closing for the 1965 season on September 15, when the Lamar market closed at the end of sales on September 14. All markets closed at the end of sales on Thursday, September 16, with the exception of the Lake City, Mullins, and Timmonsville markets. The Lake City and Timmonsville markets remained opened until September 30, when they closed at the end of sales on that date.

The only market remaining open for October sales was Mullins which closed for business on October 5, 1965.

OCTOBER SALES

The Mullins Market was open for sales on only two days in October. The two days were Monday, October 4, and Tuesday, October 5.

During October a total of 598,315 pounds of producer tobacco was sold for $339,778.15 at an average price of 56.79 cents per pound.

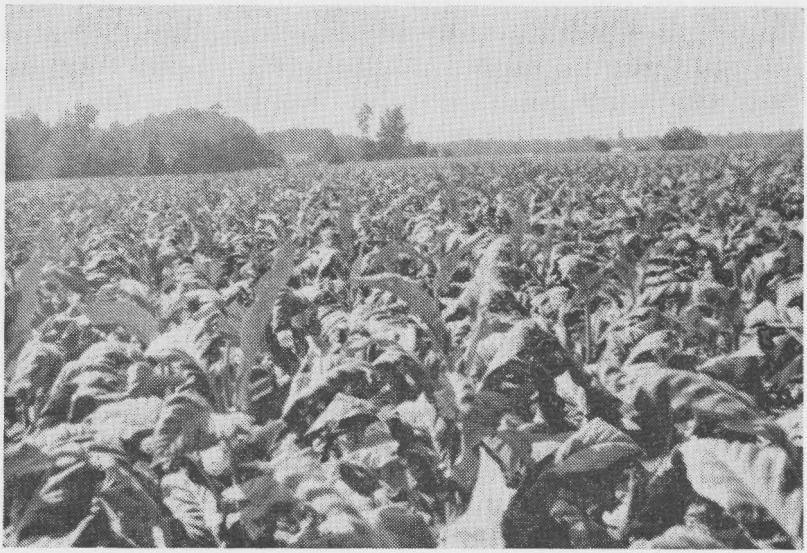
These 1965, October figures compared with October, 1964, figures of 2,431,766 pounds being sold for $1,355,213.64 at an average price of 55.73 cents per pound.

See tables at the end of this report giving a complete summary of South Carolina's 1965 tobacco sales.

The following tables give data as to South Carolina's flue-cured tobacco production for the years indicated.

A LONG YEAR

In all the farm programs, the growing and marketing of tobacco holds the record of being one farm crop that requires a thirteen month calendar. Even though the tobacco farmer doesn't operate under a special calendar, he has to work many long hours from planning a tobacco crop before planting to marketing the crop after harvesting. The many phases in which a tobacco farmer engages himself in making a crop of tobacco are covered in this report.



Tobacco Gets Its Start In A Field Like This One

HISTORY

Records indicate that our early settlers found tobacco widely used by natives from Northern Canada to lower Brazil. Tobacco was used in formalities and gatherings as well as for personal pleasure. It was also used for treatment of human diseases. Early records state that "when Mexico was invaded by the Spaniards in 1519 the people of Yucatan were growing tobacco with much care and skill." These people not only knew how to produce quality tobacco, but also how to flavor it for smoking. Throughout the Eastern United States the Indians were cultivating a type of tobacco commonly known as Rustica. The type of tobacco that we know in South Carolina was being grown at that time in Mexico and further Southward.

About 1556, settlers returning to Europe from Mexico carried tobacco into that continent. This weed was then introduced into Russia, Turkey, Persia, India, China, Japan, and Africa.

Tobacco Culture was begun at Jamestown in Virginia about the year 1612. This experience was the beginning of an important phase of agriculture and grew rapidly. This endeavor seemed to be profitable and in spite of the fast development of markets, the problem of over-production soon developed. This problem has continually plagued the industry since that time. Records show that the first efforts at Governmental Control was by limiting the number of hills or plants grown by a producer and the number of leaves that could be left on the plants. In 1639 the General Assembly of Virginia decreed a limit on production and provided that all excess should be burned.

For a number of years tobacco was abandoned as a money crop in South Carolina. In 1884, farmers in the Pee Dee section began to plant the weed in vast acreage and it soon regained its importance as a money crop. This endeavor brought about the building of the first tobacco warehouse at Florence, South Carolina in 1890.

TOBACCO TYPES

Flue-cured tobacco is the type tobacco grown most extensively in South Carolina and accounts for almost 100% of total South Carolina tobacco production as can be seen in Table 1. This tobacco is planted under government allotment and this tobacco report is devoted primarily to the flue-cured type.

Burley tobacco is another type which is grown very sparingly in this state. This tobacco is air cured rather than barn-cured. Burley tobacco is used primarily in cigars, chewing tobacco and snuff. Practically all of the Burley tobacco grown in this state is sold on the North Carolina markets, and this is principally on the Asheville, North Carolina market.

Aromatic tobacco is another type tobacco which was grown very limitedly in this state at one time. This tobacco is also known as Turkish tobacco. This tobacco was grown in the Ridge Section, Piedmont, and Mountain counties of South Carolina.

Aromatic tobacco is used to blend with other tobaccos in the manufacture of cigarettes.

RESEARCH AND DEVELOPMENT

The early settlers grew tobacco on the lighter, sandier soils and produced a light, mild tobacco that was excellent for home consumption.

Tobacco was first cured by pen fires which gave the leaf an undesirable smoky flavor. This brought about the use of charcoal and later on was replaced by the use of flues. With this improvement in curing, came a greater demand for the product and production spread throughout Georgia, Northern Florida and some parts of Alabama.

The years following these developments found more and more people interested in tobacco and more agriculturists doing research work to improve the product. Much money was spent attempting to increase quality and production and develop a tobacco that the buyers desired.

In recent years, it appears that the basic purpose of research has been defeated. The Federal Government has condemned varieties that were developed to satisfy the market, and resistant to diseases. Many hours and dollars were spent in developing these varieties only to find that they would be discriminated against by the United States Department of Agriculture. Therefore, it appears that those concerned with research and improvement find themselves confronted with a market that fails to know just what it does want. However, it is anticipated that research and development will be able to overcome this obstacle and continue to make progress as it has in the past.

Trip To Market Begins With Green Leaves Going To Curing Barn

Here's A Young Lady Helping Her Parents Put In The State's Biggest Money Crop

PRODUCTION

There are many factors involved in producing a quality tobacco. Quality is influenced by the soil type, climatic conditions, fertilization, and many other cultural practices.

Probably, soils are one of the most influencing factors and should be carefully considered. The amount of good tobacco soils in South Carolina is limited and has been the influencing factor in confining tobacco production to a definite area of the state. A good rotation program is essential, yet many farmers are curtailed in this practice due to the limited amounts of soils on their farms, that will grow quality tobacco.

Clemson College has characterized tobacco soils as to their drainage, subsoils and amount of organic matter.

1. Must be well drained—both surface and internal.
2. Must have a relatively open subsoil.
3. Must be relatively low in organic matter.

There are several soil types in South Carolina that are suitable for tobacco production, these being: Norfolk, Marlboro, Dunbar, Rustan and Lynchburg. These soils are limited and it is often difficult to carry out a good management program. Non-leguminous winter cover crops such as small grains are often plowed under on tobacco land, and as stated earlier, a good rotation is a necessity for control of diseases and to utilize the soil capabilities. It has been found that to plant tobacco behind tobacco year after year will eventually lead to trouble from diseases and insects. Another good cultural practice is that of plowing out tobacco stubbles immediately after harvest is completed. Proper plant nutrients are essential for best results in the production of flue-cured tobacco. Tobacco desires a well balanced supply of essential plant food elements throughout the early stages with a rapid decline as the crop reaches a mature stage. The fertilizer companies of the state furnishes this plant food in various forms and analysis. Farmers of the state are encouraged to have their soil analyzed and attempt to keep the P.H. around 5.2-5.5.

Good tobacco seed from a tested variety of known value is one of the most important factors in tobacco culture. Constant changing of market requirements and appearance of many dis-

eases and insects have caused seed breeders to constantly change and improve varieties.

Tobacco seed are planted on seed beds and then transplanted to the fields when they are large enough to survive and grow. These plants are either set by hand or machine. Hand setting is not practiced to any extent, however, hand transplanters are still used for this operation by most small farmers. This method often gives best results.

Tobacco requires very careful cultivation since its root system is near the top of the ground and the plant is very easily damaged. Weeds and grasses are often vigorous and must be controlled. However, the tobacco plant should be disturbed as little as possible.

The distance that tobacco is planted is a determining factor in quality production and also the yield per acre. Closer spacing of the stalks tends to utilize the plant food more extensively and reduces leaf weight. Tobacco planted more sparsely tends to give a thick heavy leaf with a coarse texture. The general rule followed in South Carolina is that of planting in 4½ foot rows and 20-24 inches apart in the drill.

Tobacco growth can be controlled, to some extent, by the process known as "Topping" and "Suckering". This process promotes leaf growth and causes thickening of the leaves and an increase in the body of the leaf. Tobacco is usually topped about eight or nine weeks after it has been transplanted. The number of leaves per hill is controlled by topping and should be a prime factor in determining the proper time to top. Clemson University recommends 18 to 24 leaves per stalk, depending on the fertility of the soil, vigor of the plants and the season. When tobacco has been "topped," it will produce a "sucker" or growth at the axis of the leaf. These "suckers" should be pulled when they are four to six inches long to prevent them from sapping the leaf and changing its composition.

HARVESTING

Tobacco harvesting in South Carolina has been described in many ways. Some call the process priming, cropping, or gathering; others call the process pulling or picking. Whatever it may be called, this process is very important and should be done with

extreme care. The tobacco is easily broken and bruised and quality can be lowered with poor harvesting practices.

In the harvesting process, the tobacco leaves are picked as they begin to ripen and turn yellow at the base of the plant. The primings and lugs are the first leaves gathered and are frequently left in the field too long, causing them to cure dark and of poor quality. After the leaves are picked, usually two or three leaves per stalk each week, they are taken to the tobacco barn, tied on sticks and hung in the barn where heat is applied. This heat draws the moisture out of the tobacco and changes the chemical composition of the weed. This change is controlled by applying various degrees of heat. Controlling the heat is also the influencing factor in controlling the coloring of the leaf and is considered the most cautious part of the entire tobacco harvesting process.

GRADING AND TYING

After the curing process is completed, there are still many factors which control the value of the leaves of tobacco. The size and body of the leaf, its chemical composition and various other factors must be considered when determining the quality of a leaf from this important weed. Color is associated with many of these factors and is probably the most important element considered when grading tobacco.

When the leaves have been sorted into grades, they are then tied into bundles or hands of uniform size. These bundles are then hung over grading sticks and packed down for several hours before they are ready for marketing.

TOBACCO AUCTION MARKET

For many years the tobacco auction market has been the meeting grounds for the tobacco grower and manufacturer. It is a place designed for bartering between the farmer and the industrialist. The growers offers the efforts of his labor and investment, in the form of the "Golden Weed," in exchange for the manufacturer's dollar.

Since the colonial days of Jamestown, tobacco has altered the culture and society of America. The planters of early days found that tobacco was an excellent bartering product. History tells us

Another Chapter In The Tobacco Story Is The Unloading At One Of The State's 40 Warehouses

that for many years they sent this product to England in exchange for various items that were needed to exist in America.

The tobacco auctioneer is the in-between man in this bartering operation. He supervises the orderly exchange between these two segments of this great industry.

In colonial days, this auctioneer was known as the "Queen's Inspector." His major duty being that of opening and inspecting all barrels of tobacco being sent to England. However, some inspectors were bribed by growers and approved inferior barrels of tobacco. With this breakdown in the inspection system, buyers tried a new informal method of "inspection and bidding" which allowed for the opening of one or more hogsheads of tobacco. A trumpet was blown and as many speculators as were ready came forward, sampled the tobacco, and bought it direct from the planter. Planters rapidly began to take their tobacco to a location where buyers were plentiful. This congestion made it imperative that some rapid and orderly sales procedure be installed. The former Queen's inspectors quickly saw this new opportunity; and in 1812, they initiated the profitable task of auctioneering.

By the early 1830's, manufacturers were beginning to buy loose tobacco directly from the grower. Soon afterwards loose leaf tobacco was admitted to the warehouses.

This new system enticed many industrialists into the tobacco manufacturing business, and pretty soon unbalanced the old law of "Supply and Demand." This period caused a breakdown in the new sales system. The farmer and manufacturer were forced to meet on the streets and "tobacco roads" to come to terms on the exchange of their products. After they agreed on the quality of the tobacco and the price to be paid, the tobacco was carried to the factory of the buyer where it was weighed on "old fashioned sword balances." The grower complained that the manufacturer was not giving him accurate weight. This complaint brought about the existence of the modern day meeting ground that South Carolinians know as the tobacco auction warehouse.

This meeting place proved to be profitable for the farmer and industrialist. For the farmer, the new plan was to eliminate the inconvenience and exposure connected with street sales, in addition to guaranteeing honest weight. Such a method also gave the manufacturer an opportunity to examine his prospective purchases under more favorable conditions.

The so-called "pinhooker" was stirred to action by this new system. Since there was no license, such as we know today, required to buy tobacco, these middlemen roamed the countryside purchasing tobacco from farmers at a reduced rate and reselling it at the markets. This middleman was assisted in his business by the fact that farmers found it expensive to ship small quantities of this "enchanting weed" to the markets. The middleman could pool his purchases and get it to market very economically, allowing him a good margin of profit.

After the Civil War, transportation was greatly improved; and farmers no longer found it necessary to sell their tobacco to the middlemen. The so-called "tobacco roads" were not busy as they were in prior years. The Slade brothers of Danville, Virginia developed a new curing system about this time and produced a new Bright Leaf product which they called Bonanza. This invention served to expand tobacco growing.

Increased production and the penetration of railroads into more southern areas made expansion of the loose-leaf sales system well nigh inevitable. The auction warehouses seemed to fur-

nish a satisfactory meeting place for the tobacco farmer and manufacturer.

The people of South Carolina owe much to Mr. Frank M. Rogers of Florence, who, after cultivating tobacco for five years, went to Durham and persuaded manufacturers to come to his city and establish a market for the tobacco farmers' product. Mr. Rogers' endeavor of 1890 marked the beginning of a prosperous industry for South Carolina.

Today there are forty tobacco auction markets in our state where our farmers offer over a one-hundred forty million pounds of "golden weed" in exchange for over eighty-six million dollars.

We can see that the efforts of those early producers to establish a satisfactory place in which to meet the manufacturer and exchange goods, were certainly well-invested efforts and have served to boost the economy of South Carolina by billions of dollars.

There's Always Time For Some Relaxation Especially With Your Friends Around
