Introduction

The term “membership,” or “average daily membership,” as used throughout this report for public schools refers to the average number of students per day on the public school rosters during the first 135 days of school. Membership counts for private schools are those students who were enrolled as of October 1 or at the end of the first month during which classes were held. Students reported by parents as being taught at home by the parents are counted as home school membership.

Membership for kindergarten through grade twelve in South Carolina public schools increased by 26,442 students, for a total of 683,313, between the 2002-2003 and 2007-2008 academic years. That increase amounts to an average gain of 5,288 students per year. In contrast, membership for kindergarten through grade twelve during the academic years from 2008-2009 to 2013-2014 is projected to increase by approximately 35,100 students, or an average of 7,020 per year. Membership for kindergarten through grade twelve in South Carolina public schools is projected to reach 722,300 in 2013–14.

Membership projections, which are calculated using average daily membership in conjunction with the cohort-survival procedure, are produced annually to give insight into trends within the state and within individual school districts. Various charts and tables are presented to facilitate educational planning. Act 164 of 1993 changed the date by which a child must attain a certain age to enter school from November 1 to September 1. The date change decreased the kindergarten membership in South Carolina schools by approximately 7,000 students in 1995–96. That class of approximately 7,000 fewer students started moving through the grade levels in 1995–96. The effect of Act 164 on membership generally diminished with the senior class of 2008.

Changes that result from future legislation or economic developments could alter the figures presented in this document. For example, the closing of a military installation could result in pupil counts lower than projected. On the other hand, the opening of a manufacturing facility could result in pupil counts higher than projected.

Membership projections for individual districts are rounded to tens, while the state projections are rounded to hundreds. Due to this rounding procedure, the sum of projections by grade may not equal the district total, and the sum of the district totals may differ slightly from the state totals.

Table 4 tracks the movement of students at selected intervals from birth to college entrance. The groups enumerated at these selected intervals contain different individuals due to migration, deaths, nonpromotions, and other circumstances. Only statewide figures are presented in Table 4. Individuals can request county figures by contacting the State Department of Education's Office of Data Management and Analysis, Research Services, at 1429 Senate Street, Columbia, South Carolina 29201, phone: 803-734-8215, e-mail: ssievers@ed.sc.gov, fax: 803-734-2983.

All state totals in this publication include only figures from the forty-six counties or eighty-five geographic school districts. Special schools and districts that serve more than one county, such as the South Carolina Department of Juvenile Justice and Felton Laboratory School, were excluded.

Caution should be exercised by all users of the projections contained in this publication because of their dependence on certain ratios remaining constant. All projections are updated each year as membership data are received and compiled by the State Department of Education (SDE).

METHODOLOGY

Cohort-Survival Procedure

Membership projections are calculated using average daily membership (ADM) in conjunction with the cohort-survival procedure. The term “membership” or “average daily membership,” as used on this report, refers to the average number of students per day on the public school rosters during the first 135 days of school, or the number of students enrolled in private schools as of October 1 or the end of the first month of school, or the number of home schooled students as reported by parents.

The cohort-survival method is one of the most widely used procedures for making short-range membership projections. This method has been used to project public school membership for grades two through twelve. Kindergarten and first grade projections are explained later in this section.

The cohort-survival method requires (1) projected first-grade membership for each year of the projection period and (2) grade-to-grade survival ratios. The projection period is the range of years for which membership is to be projected. School years 2008-2009 through 2013-2014 comprise the projection period for this report.

First-Grade Membership Projections

First-grade membership projections are based on the number of county births six years prior to the projection year and the ratio obtained by dividing the most recent first-grade membership for the county by the number of county births six years earlier.

One approach to first grade enrollment is to estimate the first grade enrollment of a particular year by using the number of live births six years earlier. This approach assumes factors, such as death and migration, tend to balance. A simple interpretation of this calculation would be $E_{c+n} = B_{c+n-6}$, where:

c = current or baseline year

n = number of projection years

E_{c+n} = projected enrollment for year $c+n$

B_{c+n-6} = births six years prior to $c+n$

Another approach to estimating first grade enrollment is to apply a ratio computed by dividing the most recent first grade enrollment by live births six years earlier to the births of more recent years. The formula for this calculation is $E_{c+n} = R_c B_{c+n-6}$, where:

c = current or baseline year

$R_c = E_c/B_{c-6}$ = ratio of current first grade enrollment to births six years earlier

n = number of projection years

E_{c+n} = projected enrollment for year c+n

B_{c+n-6} = births six years prior to c+n

In previous years, the Office of Data Management and Analysis (formerly known as Office of Research) tested these two methods for deviation from actual enrollment figures. The first approach produced a relatively constant error for each projection year. The second approach produced more accurate results for the first few years (n=1, 2, and 3) and less accurate results for higher values of n. These results led the Office to adopt a combination of these two methods which produced better results for all applicable years tested. The combination formula has been represented as $E_{c+n} = W_1B_{c+n-6} + W_2R_cB_{c+n-6}$, where E_{c+n} , R_c , and B_{c+n-6} remain as previously defined. W1 and W2, shown below, assume a different combination of values according to the projection year.

Table 1			
Values for W_1 and W_2 by Membership Projection Year			
n	W_1	W_2	W_1+W_2
1	0.15	0.85	1
2	0.25	0.75	1
3	0.30	0.70	1
4	0.35	0.65	1
5	0.40	0.60	1
6	0.45	0.55	1

As years progress into the projection period, these variables assign an increasing value to live births and a decreasing weight to the current percentage of live births. This combination formula has been used to obtain first grade projections for each county.

Finally, first grade projections by district have been obtained by prorating the county projections according to the actual school district membership for 2007-2008. Membership projections for grades 2 through 12 for years 2008-2009 through 2013-2014 have been computed using the first grade membership projections and the grade-to-grade survival ratios.

Kindergarten Membership Projections

The proportion of first-grade students enrolled in a state-supported public kindergarten program for 2007-2008 is 94.1%. The average proportion of first-grade students attending a kindergarten program in the previous year for each district has been calculated using the following formula:

$$RK_d = \frac{\text{Total Number of Students Attending Public Kindergarten Programs from 2002-2003 to 2006-2007}}{\text{Total Number of First-Grade Students from 2003-2004 to 2007-2008}}$$

To obtain the final kindergarten membership projection ($KP_{(d,y)}$), we multiply the first-grade membership projection for the following year by RK_d . This calculation is performed for each school district and each projection year. Since the last projection year for the purpose of this report is 2013-2014 and the kindergarten membership projection formula requires the first-grade membership projection for the following year (2014-2015), the 2013-2014 kindergarten projection has been assigned the same as 2012-2013.

Limitations

The cohort-survival method is a mathematical procedure based on assumptions. Results depend on these assumptions remaining stable for the projection period. Because of this dependence on variables remaining constant, the projections presented on this report should be interpreted with caution and used as one of various planning and decision-making tools.

South Carolina Grade-to-Grade Survival Ratios

The survival ratio is the quotient obtained by dividing the membership of one grade for a school year into the membership of the next higher grade a year later.

The matrix of survival ratios is computed by dividing the membership of grades one through eleven into the membership of grades two through twelve of the succeeding year. We have used five years of data to compute an average. Table 2 shows the grade-to-grade survival ratios for all South Carolina districts.

TABLE 2
South Carolina Grade-to-Grade Survival Ratios

Less Than One		Greater Than One	
Grade	Ratio	Grade	Ratio
1 to 2	0.987	2 to 3	1.008
7 to 8	0.990	3 to 4	1.011
9 to 10	0.809	4 to 5	1.013
10 to 11	0.831	5 to 6	1.022
11 to 12	0.941	6 to 7	1.012
		8 to 9	1.190

Generally, survival ratios are close to 1.0. A survival ratio of less than 1.0 indicates the net effects of students moving out of the district, deaths, non-promotions, dropouts, and transfers to private schools. A survival ratio greater than 1.0 indicates the net effects of students moving into the district, promotions, and transfers from private schools.

Although survival ratios differ by district and grade level, ratios for a given grade level and district tend to remain relatively constant from year to year. However, economic shifts and other demographic changes may affect the survival ratio for a given district or grade level, and, as a result, the survival ratios may change dramatically from one year to the next. For example, a small school district could experience a large percentage change in membership due to the opening or closing of an industrial plant within the district.

Legislative decisions, as well, may affect membership and survival ratios. For example, Act 164 of 1993 changed the date by which a child must attain a certain age to enter school from November 1 to September 1. The date change decreased the kindergarten membership in South Carolina schools by approximately 7,000 students in 1995-96. The effects of Act 164 on membership diminished with the senior class of 2008.

In order to limit the effect a sudden change in membership has on the calculation of survival ratios, a five year average of membership was used to stabilize the projections.

PROJECTIONS

South Carolina public school total membership for kindergarten through grade twelve will increase by 65,429 students in the eleven year period between 2002-2003 and 2013-2014. The net membership increase from 2007-2008 to the end of the projection period (2013-2014) is 38,987 public school students.

Table 3 shows public school membership by grade. Statewide figures represent the eighty-five school districts. Special schools and districts serving more than one county, such as the South Carolina Department of Juvenile Justice and Felton Laboratory School are excluded.

^a South Carolina Department of Education, Office of Research, Average Daily Membership by Grade, by District, 135-Day Period, 2002–03 through 2007–08. Includes student counts for the eighty-five geographic school districts.

^b The sum of the figures by grade may not equal the total due to rounding.

NOTE: District membership projections, presented later on, are rounded to the tens, while statewide projections are rounded to the hundreds. Therefore, sums of projections may not equal the totals.

Student Counts at Selected Intervals from Birth to College Entrance

State estimates of basic statistics that are relevant to educational planning in South Carolina are provided in Table 4. Actual and projected counts are included for the first, eighth, and twelfth grades in addition to actual and projected counts of high school completers and completers who enter a college degree program. All projected grade counts are based on average daily membership. Projections are located below the solid line and actual counts above the solid line.

The historical counts for live births are compiled by place of residence. These counts are taken from the various annual reports made by the State Department of Health and Environmental Control. All enrollment and membership data are taken from the official student counts collected by the Office of Finance and summarized by the Office of Data Management and Analysis--Research Services, both within the SDE. The counts for high school completers and completers entering college are taken from the 1990–91 through 1993–94 editions of the *Annual Report of the State Superintendent of Education* and the 1994–95 through 2006–07 editions of the SDE's "College Freshman Report." The numbers of high school completers entering college in the fall are identified in the source documents as students entering junior or senior colleges or degree programs in technical education colleges.

Projections of high school completers are based on the completion rate of the most recent year available. Current efforts to reduce dropouts may result in higher completion rates than those projected. Projections of the numbers of high school completers entering college are based on the college entrance rate of the most recent year available. Because less than one year elapses between a student's completing high school and his or her entering college, the percent of high school completers entering college is affected more by economic trends and alternatives to junior and senior colleges than by migration. Projected high school completers and completers entering college are rounded to hundreds.

Data in Table 4 reveal that South Carolina's live birth count increased from 49,558 in 1978 to 58,461 in 1990. By 1995, the birth count had dropped to 50,913. Since 1996, the yearly live birth count has increased to 62,318 in 2007.

^a Counts exclude students within Felton Laboratory School, the South Carolina School for the Deaf and Blind, the Palmetto Unified School District, and the South Carolina Department of Juvenile Justice. Student counts may differ slightly from cited source documents due to the inclusion of data from school reports that were received after the sources were published. Completers include diploma and certificate recipients.

^b Counts by grade will differ slightly from that shown within the source documents cited in the bibliography due to the distribution of students in upgraded classes and self-contained special education classes into the appropriate grades.

^c Counts include only the students who entered college in the fall of the school year immediately following the school year in which they completed high school.

^d Completion rate does not reflect current efforts to reduce dropouts. Some of the displayed rates for future years are partially based on factors that have already occurred. Any substantial improvement in the rates will be due to current programs, the impact of which cannot yet fully be determined.
