RICHARD W. RILEY
GOVERNOR

POST OFFICE BOX 11450
COLUMBIA 29211

July, 1985

TO: Members of the South Carolina General Assembly

It is my pleasure to transmit herewith the 1985 South Carolina Economic Report as prepared by the Office of the Chief Economist within the Division of Research and Statistical Services.

The United States and South Carolina economies surged in 1984 with the South Carolina economy outperforming the nation. Strength came mainly from the capital goods industries--construction and durable goods--with the services, trade, and tourism sectors also performing well. The strong dollar exacerbated the competitive pressures from foreign imports on the textile and closely related industries. However, other manufacturing industries performed well. With diversity of strength in some manufacturing sectors, the South Carolina economy does not seem to fit the description of the classic "two-tier" economy besetting so many areas of the country.

Farmers across the State continued under the financial stress of the past five years. Although their plight in 1984 was less severe than in 1983, an improved agricultural sector will depend upon the development of new crops and markets, the negotiation of better trade arrangements, the expansion of foreign markets and the control of production.

The outlook for the South Carolina economy remains encouraging as growth continues in line with that of the national economy, although the rate is expected to decelerate somewhat as the State follows national patterns. The South Carolina economy remains heavily tied to manufacturing and it is therefore essential that manufacturing maintain a strong presence in the State. Given the trends for growth in other economic sectors, it is also important that we promote diversification of the economy. The Governor's Export Advisory Committee was created in 1983 as a vehicle to promote export activity by small and medium sized businesses.

Yours sincerely,

Richard W. Riley

Barbara A. Feinn, Ph.D.
Chief Economist

The Honorable Richard W. Riley
Governor of South Carolina
Chairman, State Budget and Control Board

Dear Governor Riley:

It is our pleasure to transmit to you the 1985 South Carolina Economic Report, the twelfth in the series.

We have had the assistance and cooperation of many State and Federal agencies as well as of other organizations in the preparation of this report. We are deeply grateful to those who participated in this effort. The Economic Report is intended as a compact compendium of events which shaped the South Carolina economy in the previous year and a source of data on various aspects of the South Carolina economy. Within this context, we have continued to strive to make this publication as useful to as many persons as possible. We hope that the result will prove to be of great benefit.

While every effort has been made to treat all subject matter factually and objectively, it should be stated that any opinions or interpretations that might be expressed do not necessarily represent or reflect the views of the Budget and Control Board.

Sincerely,

Bobby M. Bowers
Bobby M. Bowers
Director

HIGHLIGHTS OF 1984 TRENDS IN SOUTH CAROLINA AND OUTLOOK

The South Carolina economy surged in 1984, outperforming the United States economy. Bringing the rate of inflation under control helped to cause a drop in interest rates in 1983. Lower interest rates, plus new investment tax credits, faster depreciation write-offs and the Federal program to improve the nation's roads and bridges, stimulated a resurgence in the construction, durable goods and closely related industries in 1984. These industries in South Carolina performed extremely well, helping the State to move ahead faster than the nation.

The State's trade and service sectors also performed very well in 1984. The service sector has been growing steadily, even during the recession, as South Carolina continues to follow the nation towards a more service related economy. In 1984 this growth accelerated, led by the continuing growth in tourism and recreational businesses. The advance in the trade sector was a recovery from the recession in 1980-1982.

Income from investments, interest, dividends and rents has been steadily growing as the wealth of the State grows, but the rate of growth spurted in 1984. A ratcheting up of interest rates that occurred in the second half of 1984 was a primary reason for the increase in investment income. Income from investments is now as important to the State as income from the State's largest employer, nondurable manufacturing.

Growth due to government employment and programs, which accounts for 25 percent of the State's income, was modest in 1984. Though employment by State and federal governments was stimulated by the hiring of school teachers under the Education Improvement Act, employment in other areas of State and local government was stable. Federal government employment was stagnant. Of major importance to South Carolina was the slowdown into the State of government transfer payments, which include Social Security and retirement payments, disability and health benefits and unemployment compensation. Conversely, the rate for contributions to Social Security was increased in 1984, extracting a larger share of the State's income.

Textile and closely related industries continued to suffer from severe foreign competition. These industries made enormous investments in new plants and

equipment, which impact on textile employment and reduce its share of the employment base. Some other nondurable manufacturing, particularly, printing, publishing and related industries performed well.

The agricultural sector recovered somewhat from 1983 when crop production was reduced due to the drought. Although net income of farmers was not particularly strong, cash receipts were higher due to greater production, increasing aggregate revenue to the State.

Looking ahead, the extraordinary growth in income during 1984 in South Carolina is not expected to be repeated in 1985 and 1986. The initial impetus from the federal tax changes of 1982 has already been felt, and growth in the important durable goods sector is expected to moderate. Moreover, the President's proposed depreciation write-offs and elimination of interest deductions for vacation homes could have a negative impact on the durable goods and construction sectors, particularly in the second home market. Though lower interest rates will provide some stimulus to growth in these sectors, growth still will not match the 1983-1984 experience, when there was considerable pent-up demand from the 1980-1982 recession. Tourism and recreation will continue to grow as new areas along the coast are developed, but the phenomenal rate of the past could be slowed until the effects of the final tax package are absorbed. The trade and service sectors will grow favorably and provide a major part of the forward impetus in 1985 and 1986.

Pressure to reduce the federal deficit will continue to keep growth in government employment and programs modest at best. Moreover, no new major State tax initiative, such as the 25 percent increase in the sales tax in 1984, is expected in 1986 to stimulate State employment.

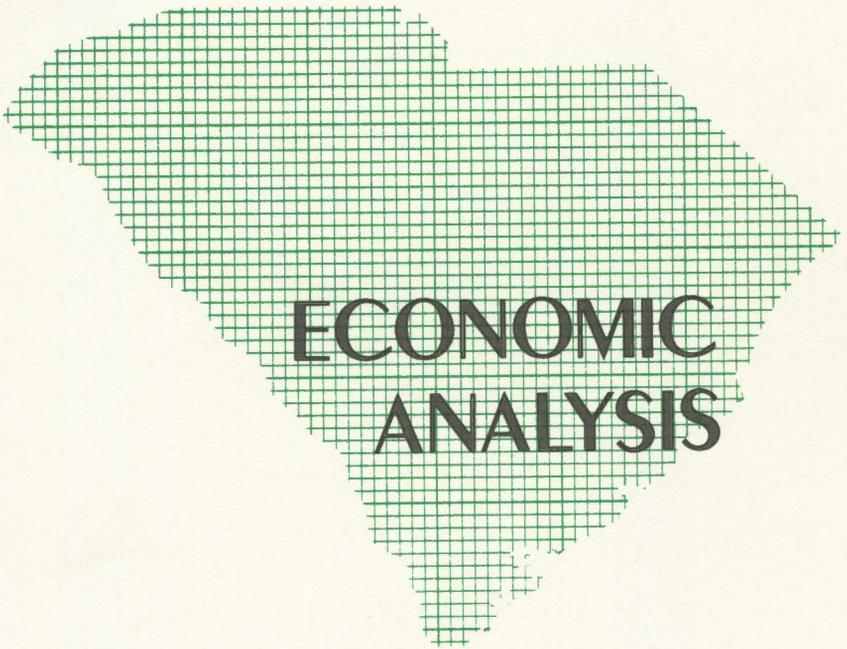

The decline in employment in the textile industry is expected to continue as textile firms install high technology equipment and close older plants to bolster their competitive position.

Overall, growth of income in the State is expected to decline to a range of 7 to 8 percent in 1985 and 1986 from its 11 percent rate in 1984.

PIRELLA

UNITED STATES ECONOMY

The economic recovery that began in 1983 rolled into 1984 with extraordinary momentum. In the first half of 1984, real gross national product grew 8.6 percent, as illustrated in Figure 1. Although real growth slowed to 3.0 percent in the second half of the year, GNP still grew 6.8 percent over the full year, its highest rate of growth since the Korean War.

The economic boom in the first half of 1984 can be attributed in large part to the carry-over of the consumer psychology and favorable business conditions that developed in 1983. During 1983, Federal Reserve policy was more accommodating, and interest rates declined. Inflation was under control, and employment and real incomes had grown comfortably. Businesses had recently received improved tax incentives, and economic conditions in general had strengthened from their dismal performance during the 1980-1982 recession. Consequently, in the first half of 1984 consumers spent heavily to satisfy the pent-up demand for durable goods which developed during the recession. Businesses also invested heavily to build structures, upgrade plants and equipment and to rebuild inventories.

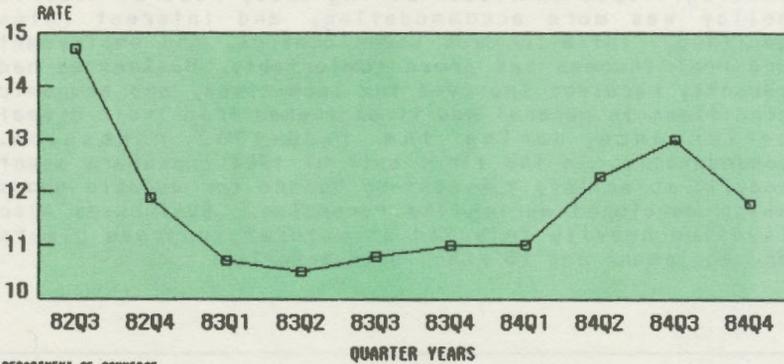

Figure 1
REAL GNP GROWTH

SOURCE: US DEPARTMENT OF COMMERCE

The slowing in the second half of 1984 can be attributed in part to higher interest rates. Fearing a renewal of inflation, the Federal Reserve became less accommodating with credit, pushing up both interest rates and the value of the dollar in the second and third quarters of 1984. Figure 2 illustrates the increase in the prime rate in 1984. Although consumers continued to increase spending on durable goods and businesses continued to invest in plants and equipment at a fairly strong pace during the second half, investment spending slowed from its first half rate, bringing down the rate of growth in the economy.

Federal Reserve Policy and Interest Rates

Federal Reserve policy to fight inflation has had an extremely important influence on interest rates and economic activity since 1979. With inflation averaging over 13 percent in October 1979, the Federal Reserve adopted its new policy to fight inflation, which put more emphasis on regulating bank reserves and monetary growth and less emphasis on holding interest rates stable. Since then the Federal Reserve has established targets of monetary growth and regulated Federal Reserve credit reasonably consistent with targets.

Interest rates have been allowed to fluctuate in order to regulate economic conditions. As a result, since 1979 interest rates have been more volatile than at any time in recent history. Prior to the new policy, only once since the Great Depression did the prime rate exceed ten percent, which was in 1974, and then it was only 10.8 percent.

Throughout the period, 1980 through 1981, the Federal Reserve generally maintained a tight credit posture. It extended credit to the banking system at a rate of approximately six percent per year, which was in line with historical experience, but not sufficient to feed the level of inflation, which averaged 12.4 percent in 1980 and 8.9 percent in 1981, well above historical rates. During this period, the prime rate of interest fluctuated over an extremely high range, from 11 to 20.5 percent, depending on economic conditions. It averaged 15 percent in 1980 and 18.9 percent in 1981. Historical interest rates are shown in Figure 3.

Figure 3
PRIME INTEREST RATE

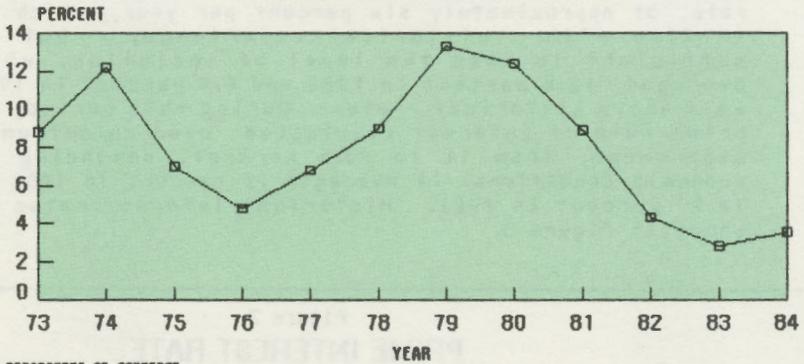

SOURCE: US DEPARTMENT OF COMMERCE

By 1983 the rate of inflation fell below four percent from its peak of 13 percent in 1979, as illustrated in Figure 4, giving the Federal Reserve room to extend more credit. In 1983 the Federal Reserve increased its credit an average 7.3 percent.

With inflation lower, this level of credit was sufficient to meet the needs of the financial system and permit economic expansion. As a result, interest rates generally declined, providing the relief from high interest rates that consumers and businesses needed to start the recovery in 1983.

Figure 4
CONSUMER PRICE INDEX

SOURCE: US DEPARTMENT OF COMMERCE

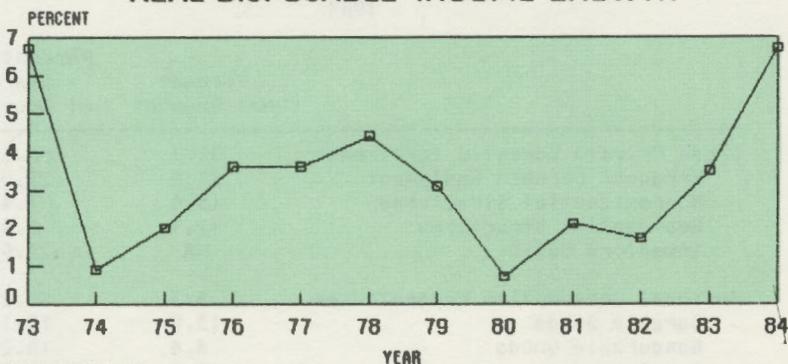

During the recovery of 1983, rapid growth in the economy rekindled fear of another inflationary attack. In the latter half of 1983, and the first quarter of 1984, the Federal Reserve became stingy again with credit, with the aim of slowing economic growth in order to protect against inflation. Interest rates began to inch up slowly in the second half of 1983, partly driven by the recovery and partly driven by tighter monetary policy. Interest rates peaked in the second quarter of 1984, causing slower growth in the latter half of the year.

Inflation, Employment and Income Growth

The reduction of the rate of inflation had an important impact on the real incomes and wealth of consumers. In 1983, the enormous inflation of the late 1970's and early 1980's had been rung from the economy. Prices rose 3.2 percent in 1983, their lowest level

since 1967. Employment began to recover in 1983, and personal incomes in general grew 10.3 percent, before adjusting for inflation. With relatively low inflation, real disposable income of consumers grew approximately four percent, as seen in Figure 5, which was one of the better years for real income growth. This growth of real wealth helped to contribute to the buildup in consumer confidence that occurred prior to 1984.

Figure 5
REAL DISPOSABLE INCOME GROWTH

SOURCE: US DEPARTMENT OF COMMERCE

Personal income of consumers before adjusting for inflation grew over 11 percent in 1984. Inflation remained under control by recent standards at slightly more than four percent. As a result, the real income of consumers grew over six percent in 1984, better than in 1983 and one of its best years. Real income growth provided additional wealth to consumers which helped them incur more debt to purchase durable goods and to save, which provided additional funds for business investment.

Demand For Durable Goods

Expenditures by consumers to satisfy pent-up demand for durable goods were a significant factor in the growth in GNP that occurred in 1984, accounting for nearly one-fifth of the 6.8 percent growth in real GNP.

Table 1 illustrates the rates of growth in the major economic sectors and the percentage share of the growth accounted for by each sector. Automobiles were the main items which consumers purchased. Pent-up demand for durable goods, particularly automobiles, had been building since 1979 when the extraordinary run-up in oil prices forced consumers to conserve on purchases of large items. Consumers were forced to keep old durable goods longer before replacing them.

**Office of Chief Economist, S.C. Division of
Research and Statistical Services

Moving into 1984, interest rates were still lower than during the recession and consumers still had considerable pent-up demand for durable goods which had not been satisfied in 1983. Consumers took advantage of the lower interest rates and stepped up their purchases of durable goods in the first quarter 1984 by 14.8 percent before adjusting for inflation. Consumers

borrowed heavily to finance these purchases. However, in the second and third quarters of 1984, the Federal Reserve tightened credit, and interest rates moved back up, reducing the increase in consumer purchases of durable goods to 12.6 percent in the second quarter and 4.4 percent in the third quarter.

Because the economy slowed dramatically in the third quarter, growing only 1.6 percent, the Federal Reserve again took off the brakes. Interest rates fell and durable goods purchases revived in the fourth quarter, rising at an annual rate of 11.5 percent, unadjusted for inflation.

Nondurable Goods and Services

Purchases of nondurable goods and services in 1984 were less sensitive to swings in interest rates than durable goods purchases and more closely related to income growth. Together they accounted for 31 percent of the growth in real GNP.

During the first half of 1984, nominal purchases of nondurable goods and services grew at an annual rate of 8.4 percent, which was less than the 10.2 percent growth in disposable income over the same period. In the second half of the year, growth in disposable income slowed to 7.4 percent, and consumers reduced their growth in expenditures for nondurable goods and services to 5.8 percent.

Private Investment

Private investment accounted for two-thirds of the growth in real GNP in 1984. Businesses spent 21.5 percent more in 1984 than in 1983 for durable equipment after adjusting for inflation. They also increased their real expenditures for structures by 15.6 percent over 1983. Real investment in residential structures jumped by over 12 percent.

Tax incentives for businesses provided in the Federal Tax Equity and Fiscal Responsibility Act of 1982 were an important factor in the investment decisions of businesses in 1984. The Act provided income tax credits for investment and faster write-offs of depreciation, which reduced the risks and costs of capital improvements.

Lower interest rates were also important in stimulating investment in the first half of the year. The decline in the prime rate from an average 14.9 percent in 1982 to an average 10.5 percent in 1983 helped provide extra stimulus for investment in 1983 that carried over into 1984. Fixed mortgage rates fell from over 15 percent to 13 percent. Adjustable rates generally fell about two and one-half percentage points also.

However, by the third quarter 1984 the prime rate had moved up to 13 percent from 10.5 percent in 1983. Fixed mortgage rates had risen to 14.5 percent from 12.5 percent in 1983. As a result, the growth in business investment slowed to 13.7 percent in the third quarter of 1984 and 8.5 percent in the fourth quarter. Residential investment also fell in the third and fourth quarters of 1984.

Business Inventories

Growth in business inventories accounted for 27.9 percent of the growth in GNP. Part of the growth in inventories was to rebuild stocks that were drawn down in 1983. Another part of the increase in inventories was due to the desire by businesses in the early part of the year to maintain adequate inventories to meet sales levels. In the first half of the year when sales were rising at an annual rate of 10.8 percent, businesses built inventories at an annual rate of 12.4 percent, just somewhat more than sales growth. Over this period the inventory to sales ratio increased to only 1.32 from 1.30 at the beginning of the year.

However, in the second half of the year, the rate of increase in sales declined, but businesses continued to increase production through September, at which time the inventory to sales ratio had increased to 1.37. At that point, faced with higher interest rates, a slowing economy, and increased foreign competition, businesses began to cut production. But inventories continued to build, even though sales held up, as retailers imported more foreign goods to meet sales. In the fourth quarter businesses were under intense pressure to cut inventories. Not only did inventories build significantly relative to sales, but the carrying costs of inventories were exacerbated by rising interest costs. From the first quarter 1984 to the fourth quarter 1984, the annualized costs of carrying inventories rose 53 percent. In the fourth quarter,

interest costs for inventories rose to approximately \$87 billion annually from \$57 billion in the first quarter. This amounted to 37 percent of the annual earnings of \$236.2 billion in 1984, up from 24 percent at the beginning of the year.

Foreign Trade

Foreign trade was a serious problem for the U.S. economy in 1984. During 1984 the value of the dollar rose roughly fifteen percent against foreign currencies, making foreign goods that much cheaper for U.S. consumers. This followed an increase of approximately ten percent in 1983. Over a two-year period, the value of the dollar reduced the cost of foreign goods and raised the price of U.S. goods by roughly 25 percent.

The merchandise trade balance increased from a deficit of \$61 billion in 1983 to \$108 billion in 1984. The merchandise trade balance includes sales of goods and services. The Balance on Current Account, which adds to the trade balance earnings from overseas investments, rose from a deficit of \$42 billion in 1983 to a deficit of \$102 billion in 1984. In 1982 the deficit in the Balance on Current Account was only \$9.2 billion and in 1981 the Balance on Current Account was a surplus of \$6.3 billion.

The net impact on gross national product of the foreign trade sector was to reduce the growth in real GNP by 1.8 percentage points.

Government Sector

Purchases by Federal, State and local governments contributed little to the growth in GNP. Purchases of goods and services by the government sector rose only

3.5 percent in 1984, accounting for ten percent of GNP growth. Defense expenditures grew 5.8 percent, whereas federal nondefense expenditures grew a lesser 4.4 percent.

State and local government purchases grew only 2.2 percent in 1984. This growth generally reflects weak tax collections in 1983 and conservative budgets for 1984 for many states.

Summary

The remarkable growth of the U.S. economy in 1984 was in most part the result of a resurgence in private investment. Manufacturers of durable goods had a very favorable year as consumers satisfied pent-up demand for durable goods, more than offsetting sluggish growth in some of the nondurable industries and the government sector. Lower interest rates and improved tax incentives and consumer psychology provided the stimulus needed for the resurgence in the investment and durable goods sectors. On the other hand, the high value of the dollar shifted the competitive balance of many U.S. nondurable goods industries versus foreign producers, causing sluggish growth in the nondurable goods manufacturing sector.

EVOLUTION

2011

SOUTH CAROLINA ECONOMY

Introduction

The economy of South Carolina moved forward into 1984 even more strongly than the phenomenal growth nationwide. Personal income grew 11.1 percent in the State, whereas nationwide it grew 9.3 percent. Growth in South Carolina was strongest in the first half of the year when the national economy was surging forward, and fell off in the latter half after interest rates had moved up and the national economy was losing momentum.

Several factors contributed to this extraordinary growth in the State, but clearly a large part of the forward impetus came from those manufacturing industries most sensitive to swings in interest rates. Construction and related industries experienced a boom as the coastal areas continued to grow, housing throughout the State rebounded, and consumers and businesses generally took advantage of lower interest rates at the beginning of the year. Also, manufacturers in South Carolina of fabricated metals and glass for autos experienced a strong year due to the rebound in car purchases nationwide, which was in part influenced by lower interest rates, and special interest incentive programs offered by automobile companies. Although not as directly influenced by interest rate swings, the service, retail and wholesale trade sectors provided additional impetus to the growth in the State, continuing the long term trend towards a more service related economy. Another important factor was the dividend, interest and rental income earned by the residents of the State from their investments. Nearly one-fifth of the extraordinary income growth during 1984 in the State was derived from investment income.

Not all sectors of the South Carolina economy fared well in 1984. The textile and related industries, which are the largest employers in the State, were generally stagnant during the year. The industry was hurt by intense foreign competition, which was aided by the strong U.S. dollar.

Nonagricultural Employment

The extraordinary growth in the economy of South Carolina during 1984 had one of the most favorable

Impacts on employment the State has ever seen. During the year, 82,600 jobs were added over the level in 1983, bringing the rate of unemployment down to 7.1 percent from 10.0 percent in 1983. Employment grew 6.9 percent in South Carolina, whereas it grew 4.3 percent nationwide.

There were many reasons for the high level of growth in employment in the State, but five were especially significant: 1) improved federal corporate tax incentives, 2) lower interest rates, 3) the federal program to repair the nation's roads and bridges, 4) general growth in purchasing power in the State and 5) the hiring of school teachers under the Education Improvement Act.

The retail and wholesale trade sectors added 22,600 employees for a 9.4 percent increase, the largest increase in the number of employees of any industry sector in the State. Table 1 shows the gains in employment for the major sectors of the State's economy. A general increase in purchasing power of consumers as the economy recovered from the recession was the primary reason for this growth. Although foreign imports hurt several key manufacturing industries in the State, imports generally helped retailers, as they were able to expand their volumes of sales with lower priced imports. The value of retail sales rose along with income at 11 percent in 1984, providing the additional revenues to add new stores and expand staffs at existing stores. In past years retail sales have grown more than income in the State as consumers accrued more discretionary money. However, in July 1984 the sales tax was raised one cent per dollar, reducing the incremental impact on sales of higher income.

The service sector added 17,600 jobs in 1984, continuing its long term trend in growth. The service sector has been a significant growing part of the South Carolina economy for years, but has been growing faster in recent years as the State has been catching up to the national trend towards a more service dependent economy and South Carolina's recreation and tourism business has continued to grow. Even during the depths of the recession in 1982, when most industries in South Carolina cut back on employment, the service sector continued to expand. In 1984, recreation and tourism boomed in the State. Sales by hotels and restaurants

rose 19 percent to almost \$2 billion. The service sector also includes hospital employees, doctors, lawyers, plumbers, various other household service workers, teachers at private institutions and many other varied service-type employees.

Table 1
NET JOBS ADDED IN SOUTH CAROLINA DURING 1984

Sector	Increase in Net Jobs from 1983 to 1984	Percent Increase	1984 Percent of Total Employment
Retail and Wholesale Trade	22,600	9.4	20.6
Services	17,600	9.8	15.5
Construction, Real Estate, Finance and Insurance	14,900	12.3	10.7
State and Local Government	9,900	5.2	16.0
Federal Government	200	0.5	2.9

Manufacturers of Nondurable Goods	4,200	1.7	20.1
Transportation & Public Utilities	1,500	2.8	4.4
Total	82,600	6.9	

Source: Office of Chief Economist from data compiled by the S.C. Employment Security Commission

Lower interest rates provided the stimulus for growth in the construction, finance, insurance and real estate businesses, as consumers sought to satisfy pent-up demand for housing. When interest rates came down in 1983, the construction business began to pick up. The value of construction contracts rose 27 percent in 1983, mostly for residential structures. However, due to the lag in getting housing projects started, most of the impact on the construction business was not felt until 1984. In 1984, the construction industry added 11,400 jobs. Real estate, insurance, and finance companies, businesses which normally are closely dependent on the housing sector, added another 3,500 jobs, for a total of 14,000 new jobs in this sector.

Manufacturers of durable goods increased employment by 11,700 over 1983. Lower interest rates, improved tax incentives and a major effort by the Federal government to improve the nation's roads and bridges were major factors in causing employment growth in this sector.

Producers of nonelectrical machinery increased employment by 11.7 percent as a result of the boom in demand for construction equipment that occurred nationwide. The five cent per gallon increase in the Federal excise tax on gasoline in April 1983, raised approximately \$5 billion to rebuild the nation's roads and bridges. This helped to increase the general need for nonelectrical machinery, much of which is used in the construction of bridges and highways. Moreover, the six percent investment tax credit and faster write-off of depreciation expenses provided in the Federal Tax Equity and Fiscal Responsibility Act of 1982 gave construction businesses additional incentive to buy new nonelectrical machinery.

State and local governments of South Carolina increased employment by 9,900 in 1984. A large part of this increase was the result of hirings to improve education at the primary and secondary levels. In July 1984, the State passed the Education Improvement Act, which increased the sales tax from four cents to five cents per dollar, with funds from the additional one percentage point earmarked to raise teacher salaries and to provide full staffing in schools.

Even though the national and State economies fared extraordinarily well in 1984, employment in several key manufacturing industries in South Carolina fared poorly due to the rise in foreign competition and the need to increase productivity. In the last two years, the textile industry has invested \$587 million to modernize its plants and increase productivity. But profits for textile companies have not been particularly strong. As a result, employment fell by 0.3 percent in 1984. Likewise, manufacturers of chemical and allied products invested over one billion dollars in the last two years in plants and equipment in the State, which has resulted in very little growth in employment. Whereas the textile and chemical industries accounted for nearly one-fifth of employment in the State ten years ago, they now account for only a little more than one-ninth of the State's employment.

The strong value of the dollar has also had a depressing impact on employment for the State's processors of food and kindred products. Overall, employment by these processors was stagnant because even though domestic sales were up, foreign sales were down.

In 1983, \$400 million of agricultural products, or 33 percent of the State's agricultural production, was exported. Agricultural exports fell to \$300 million in 1984, or 28 percent of the State's production.

Personal Income

Personal Income is one of the most important indicators of the economic health of the State. In 1984, personal income grew 11.1 percent, which was a particularly favorable increase in comparison with an inflation rate of only 3.2 percent. Growth in

Table 2
SOUTH CAROLINA PERSONAL INCOME GROWTH BY SECTOR
1983 and 1984

Sector	Percent Increase in Personal Income

Total Personal Income for South Carolina	7.8	11.1

Source: Office of Chief Economist from data compiled by the U.S. Department of Commerce

employment and higher wages net of Social Security payments accounted for roughly two-thirds of the income growth. Higher earnings from other sources including dividends, interest, rent, transfer payments and higher farm income accounted for the other one-third of income growth. Table 2 shows the percentage growth of income in each major sector of the State for 1983 and 1984. Table 3 shows the contribution to overall income growth by each major sector. Table 4 shows the share of total income in the State generated by each sector.

Income from manufacturers of durable goods grew 16.8 percent in 1984, one of the best sources of income growth in the State. This was primarily the result of the enormous demand for capital equipment that occurred nationwide and the high incidence of these kinds of plants in the State. Although this industry employs less than ten percent of the workforce and accounts for eight percent of income in the State, it accounted for 15 percent of income and employment growth.

Table 3
PERCENTAGE OF SOUTH CAROLINA
EMPLOYMENT AND INCOME GROWTH
ACCOUNTED FOR BY EACH SECTOR IN 1984

Income also showed strength in the trade and service sectors, as a result of higher employment and generally improved economic conditions. However, many jobs in these sectors tend to be lower paying than in other sectors. As a result, these sectors contributed less to income growth than to employment growth. Together the trade and service sectors accounted for a little less than one-fourth of income growth, whereas they employed over a third of the workforce and accounted for almost half of the increase in employment in the State.

The rebound of the housing and construction industry was also a significant source of income for the State, accounting for 11.7 percent of total growth in income. Income grew 17 percent in this sector in 1984.

Manufacturers of nondurable goods, which account for 20 percent of employment and 15 percent of income in the State, contributed only nine percent to the growth of the State's personal income. Although some particular industries in the sector fared reasonably well in 1984, for example, paper and printing businesses, the sector generally fared poorly as a result of the continuing problems of textile manufacturers and their importance to the State. Income in the sector grew only a modest 6.5 percent.

Growth in State and local governments accounted for six percent of the growth in income even though this sector employs 16 percent of the workforce. Higher employment as a result of the Education Improvement Act was offset by income increases for State employees which were less than the 11 percent for the economy as a whole. This caused this sector to have a lesser impact on income growth than employment growth.

Transportation and communications companies, public utilities, and the federal government contributed little to income growth in the State. Moreover, higher rates for Social Security payments significantly reduced the rate of net income growth in the State by 0.6 percentage points. In 1984 the total amount of Social Security payments in South Carolina increased 12.4 percent. The contribution rate was raised from 7.00 percent to 7.05 percent, and the maximum earnings subject to the Social Security tax were raised to \$39,000 from \$37,800.

Income from sources other than employment accounted for a third of the increase in income in South Carolina. Investment income from dividends, interest and rent rose 14 percent in 1984, accounting for 18 percent of the increase in income of the State. For the most part, the extraordinary rise in this income resulted from generally higher interest rates in 1984. Income from interest, dividends and rents rose 5 percent in 1983, when interest rates were falling.

Income generated in the farm sector, including wage and salaries of farm workers and the value of farm production added to inventories, rebounded in 1984 to \$401 million from \$108 million, as a result of greater crop production. Production was off in 1983 for selected crops due to drought conditions. Although the farm sector generates only one percent of the State's

income, the rebound in income in this sector caused income for the State as a whole to rise a full percentage point.

Transfer payments, which include Social Security retirement, medicare and medicaid benefits, represent 15 percent of the personal income in the State. As a result of lower inflation and a general tightening of these programs, these payments grew a modest 4.8 percent in 1984, down from 6.9 percent in 1983. Transfer payments accounted for only six percent of income growth in 1984, whereas in 1983 they accounted for fourteen percent of income growth.

Per Capita Income

Per capita income is an important indicator of the social and economic health of residents in the State and is used to adjust transfer payments to the State under certain Federal programs. Per capita income in South Carolina grew 9.9 percent in 1984 to \$10,075 annually. This increase was higher than the 8.7 percent increase of both the Southeast and the nation. South Carolina moved from the forty-sixth State in per capita income to the forty-fifth ranked State. As a result, a small downward adjustment in South Carolina's share of Federal payments under the Medicaid Program will occur.

After adjustment for inflation, per capita income rose 6.5 percent in 1984, its best growth in over fifteen years. In 1983 it grew 2.9 percent, and during the 1982 recession when inflation was high, it declined 0.7 percent.

Average Manufacturing Weekly Hours and Earnings

The average manufacturing workweek and weekly earnings are indicators of the monthly swings in manufacturing activity. During the recovery of 1983 the average manufacturing workweek moved from 38.8 hours at the end of 1982 to 40.7 hours at the end of 1983. During 1984, however, the workweek generally stabilized, except for the period May through August, when it fell off slightly. This indicated the maintaining of strength that occurred in the manufacturing sector throughout 1984. Average weekly earnings grew from \$293 at the beginning of 1984 to \$306 at the end of the year, or four percent, as a result of higher wages, and helped to contribute to income growth.

Demand for Vehicles

Sales of new cars and trucks was one of the best growing sectors of the South Carolina economy in 1984, continuing the recovery of the auto sector that began in 1983 when consumers bought autos to satisfy pent-up demand built during the recession. In 1984, new car registrations rose 16 percent, following a 25 percent increase in 1983. Though interest rates generally rose in 1984, auto companies provided several interest rate incentive programs which helped to mitigate the impact of higher interest rates on auto sales.

Summary

The South Carolina economy grew more than the national economy in 1984. A rebound in nationwide demand for autos, other durable consumer goods, construction equipment, recreation, tourism, and housing were among the principal factors contributing to South Carolina's growth in 1984. Growth in income from investments was another important factor. On the other hand, the textile and related industries and the government sector, significant employers in the State, showed little growth in 1984. Per capita income in the State also increased at a rate higher than in the nation and the Southeast, raising the State one notch from forty-sixth to forty-fifth, the best ranking ever for the State in this comparison.

**ECONOMIC
ACTIVITY**

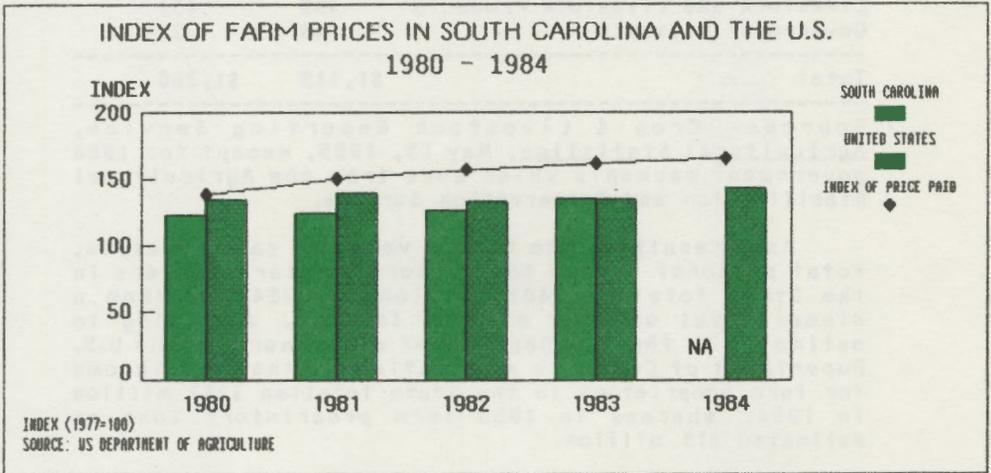

AGRICULTURE

УСВИДЕТЕЛЬСТВО

AGRICULTURE

The prosperous agrarian economy of the 1920's in South Carolina has been scarred severely by the hard times of the 1980's. From 1980 to 1984 the number of farms in South Carolina has declined 18 percent and currently the agricultural sector accounts for only 1.2 percent of total personal income in the State. Farmers across South Carolina and the nation continued to face rising production costs and poor prices for their produce during 1984. In addition the agricultural sector has been plagued by many other problems such as high interest payments on accumulated debt; declining land values for loan collateral; overproduction which has led to surpluses and lower commodity prices; higher production expenses; the strong dollar which has made domestic commodities more expensive than those of foreign competitors; and the perils of nature such as droughts, late freezes and disease.

Cash Receipts from Farm Marketings

The agricultural sector of South Carolina had a better year in 1984 than in 1983 when the State's farmers suffered under drought conditions. Cash receipts from the sale of crops totalled \$826 million in 1984, up from a drought-stricken \$658 million in 1983.

Cash receipts from livestock and livestock products rose to \$430 million in 1984 from \$409 million in 1983. Government payments to farmers, however, were down in 1984, as transfers under the Payment-in-Kind (PIK) Program dropped to an insignificant level. Other payments under various programs continued at roughly the same levels as in 1983. Overall, government payments totalled \$22 million in 1984, down from \$48 million in 1983. Total receipts from crops and livestock plus government payments were \$1.3 billion in 1984, an increase of 18 percent over the \$1.1 billion in 1983.

Table 1
CASH RECEIPTS FROM FARM MARKETINGS
IN SOUTH CAROLINA
(In Millions of Dollars)

	1983	1984
Crops	\$ 658	\$ 827
Livestock and Livestock Products	409	431
Government Payments	48	22
Total	\$1,115	\$1,280

Source: Crop & Livestock Reporting Service, Agricultural Statistics, May 15, 1985, except for 1984 government payments which were from the Agricultural Stabilization and Conservation Service.

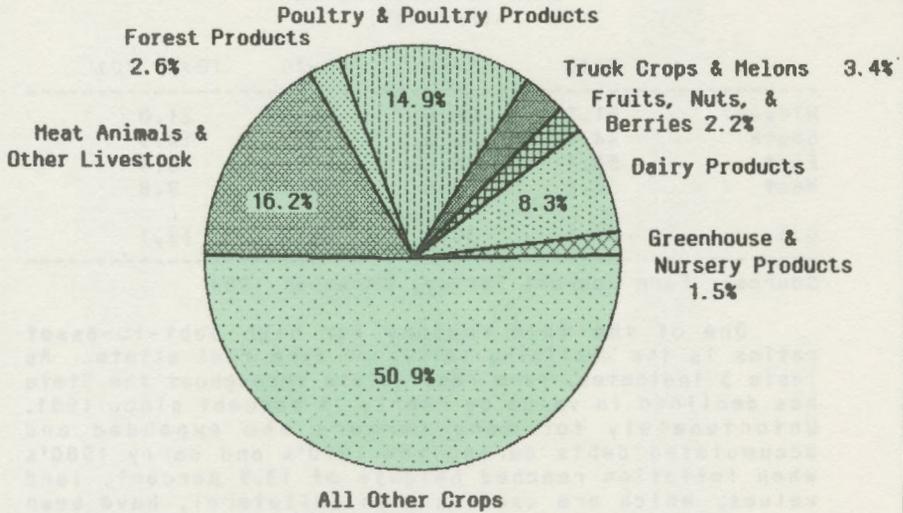

As a result of the higher value of cash receipts, total personal income for farmers and farm workers in the State totalled \$401 million in 1984, up from a dismal level of \$108 million in 1983, according to estimates by the U.S. Department of Commerce. The U.S. Department of Commerce also estimated that net income for farm proprietors in the State totalled \$287 million in 1984, whereas in 1983 farm proprietors lost an estimated \$15 million.

Farmers' Financial Conditions

Farmers in the South and East generally fared better financially than farmers in the Midwest based on debt-to-asset ratios. As seen in Table 2 the farmers in the Midwest had the highest debt, with 21 percent of farmers in the Midwest having a debt-to-asset ratio of over 70 percent, whereas farmers in the South and East had the highest percentage of farmers in the lower debt-to-asset classes.

One of the main reasons for high debt-to-asset ratios is the declining values of farm real estate. As Table 3 indicates, farm real estate throughout the State has declined in value by nearly 15 percent since 1981. Unfortunately for many farmers who expanded and accumulated debts during the 1970's and early 1980's when inflation reached heights of 13.5 percent, land values, which are used as loan collateral, have been deflated.

Table 3
SOUTH CAROLINA FARM* REAL ESTATE VALUES
1979-1984

	Total Value	Value of Farm Buildings	Average Value per Acre of Land & Buildings	Average Value per Operating Unit
	(In Million Dollars)		(In Dollars)	
1979	\$5,025	\$ 935	\$773	\$143,600
1980	5,627	1,018	879	160,800

Farm Credit

The largest farm lenders in South Carolina are the Federal Land Bank Association, the Production Credit Association and the Farmer's Home Administration. Of these the Federal Land Bank Association is the largest farm lender and mainly provides long-term farm financing. The Federal Intermediate Credit Bank provides loans to Production Credit Associations, who in turn mainly provide short-term operating loans to farmers. The U.S. Department of Agriculture also provides loans through the Farmer's Home Administration which has the highest delinquent loan rate of these three main lenders. As seen in Table 4, during 1984 over 30,000 loans were outstanding from these three lenders, amounting to nearly \$1.4 billion. Over 12 percent of these loans were delinquent, totalling over \$101.3 million.

South Carolina Farm Exports

The strong U.S. dollar has made domestic commodities more expensive than those of foreign competitors and as a result, South Carolina's agricultural exports fell to \$300 million in 1983 from \$407 million in Fiscal Year 1982. The State's leading export crops continue to be unmanufactured tobacco and soybeans. The exported value of unmanufactured tobacco

from South Carolina was \$137 million in Fiscal Year 1982. South Carolina was ranked third in the nation as an exporter of tobacco. In combination with tobacco exports, soybeans, wheat, feed grains and cotton exports account for 90 percent of the State's total agricultural exports.

Farm Export Outlook

The export outlook for the agricultural sector is clouded by growing foreign competition, partly due to the continuing strength of the dollar in foreign exchanges, by the sluggishness of economic recovery in Europe and elsewhere and by the debt problems of

important developing countries. Agricultural exports are projected by the U.S. Department of Agriculture to decline from \$38 billion in 1984 to \$36.5 billion in 1985, while imports are projected to rise slightly from \$18.9 billion in 1984 to \$19.0 billion in 1985.

Peach Production in South Carolina

According to the S.C. Crop and Livestock Reporting Service the State's peach growers will be shipping 180 million pounds of fruit in the 1985 season, about 75 percent of a maximum production of 240 million pounds. During 1984 peach growers in the State produced a record 440 million pounds. The current outlook for 1985 based on May 1 conditions is about half the size of the 1984 production. This lower production forecast is due to freeze damage in January, March and April which devastated much of the Piedmont Crop and damaged or destroyed many early varieties along The Ridge and in the Low Country. Peach production for 1985 in the nine southern states is forecast at 369 million pounds, down 52 percent from 762 million pounds last year.

Outlook

During 1985 cash receipts in the State and the nation from marketings of crops and livestock are expected to be higher than 1984 levels. However, these stronger cash receipts will be more than offset by lower government payments and higher production expenses resulting in persistent cash flow problems for many farmers.

Some agricultural producers are not as stressed as others by financial problems. Livestock producers have benefited from the deterioration of crop prices since feed such as corn and soybean meal is the largest major cost in livestock production. Livestock producers however are also faced with import problems and the strength of the dollar. Although the dollar is expected to decline from the extraordinarily high levels of 1985, it will remain strong enough to continue to keep a lid on U.S. agricultural exports. The volume of U.S. agricultural exports is expected to decline nearly 4.0 percent while agricultural imports are expected to rise 0.5 percent. Imports of Canadian hogs and cows are expected to continue during 1985.

The use of fertilizers such as nitrogen, phosphate and potash is likely to remain unchanged in 1985. U.S. nitrogen exports are expected to rise as the continued recovery in world economic activity strengthens fertilizer demand.

Current demand projections for 1985 farm machinery sales should be similar to 1984 levels. Sales of farm machinery are affected by the continuing poor financial conditions in the farm sector and the direction of future farm policy as it influences the long-term demand for farm machinery. The production of farm machinery employs approximately 1,300 workers throughout the State.

Summary

Little relief is anticipated for farmers weathering the financial stress which has lingered over the agricultural sector during the past five years. However, the problems facing farmers in the State and the Southeast should continue to be less severe than those for farmers in other parts of the nation.

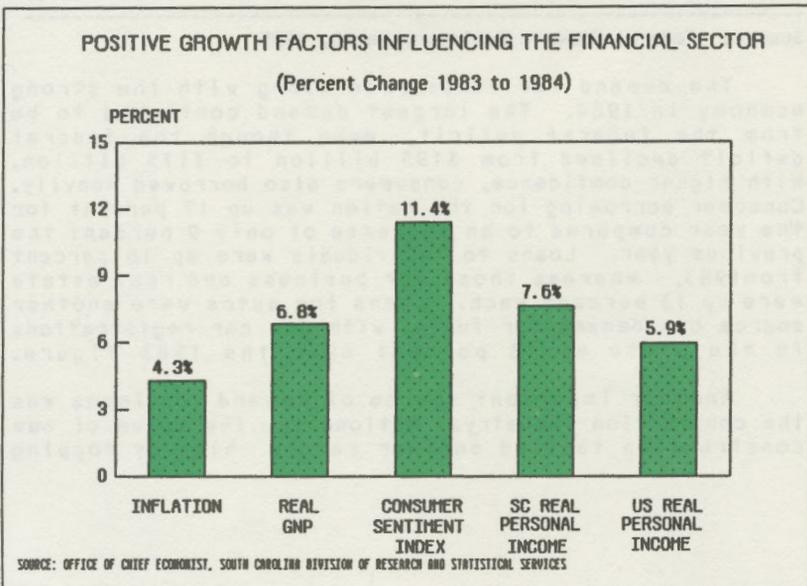

FINANCE

FINANCE

The financial sector in 1984 of the United States continued to be burdened by the huge and growing federal deficit. However, there were developments in 1983 and 1984 which helped to improve the health of the sector. Probably the most important was the bringing of inflation under control in 1983, which remained relatively low in 1984. Also of importance was the growth in real personal income which provided consumers more discretionary income to increase personal savings and general household liquidity. Finally, improved business conditions were a plus, particularly for the corporate sector, whose profits and cash flow were up considerably.

Although the federal deficit continued to be a major drain on loanable funds, the improved financial sector was able to supply adequate funds to cover the growing federal deficit and meet the huge investment demand of the private sector. The growth in real income helped personal savings rise 32 percent. Business savings from profits and depreciation allowances rose 38 percent. Savings from State and local government increased 20 percent. The flow of foreign capital continued to move into the U.S. due to improved business conditions and higher interest rates. All of these savings were major reasons for the increase in the supply of funds.

The Federal Reserve, on the other hand, did not contribute significantly to the supply of funds. With the extraordinary growth of the economy in 1984 and the accompanying growth in the money supply, the Federal Reserve became concerned about higher inflation. Consequently, the Federal Reserve tightened credit, allowing it to increase only 2.3 percent for the year, compared to over 7 percent in 1983. As a result, interest rates rose during the first three quarters of 1984 before dropping back in the final quarter. Interest rates ended the year higher than in 1983, but were still below 1982 levels.

Source: Federal Reserve Bulletin, March, 1985

The demand for funds rose along with the strong economy in 1984. The largest demand continued to be from the federal deficit, even though the federal deficit declined from \$195 billion to \$175 billion. With higher confidence, consumers also borrowed heavily. Consumer borrowing for the nation was up 17 percent for the year compared to an increase of only 9 percent the previous year. Loans to individuals were up 18 percent from 1983, whereas those for business and real estate were up 13 percent each. Loans for autos were another source of demand for funds, with new car registrations in the State up 16 percent over the 1983 figure.

Another important source of demand for loans was the construction industry. Nationally, the value of new construction tallied another record high by topping

last year's mark by 8 percent. Construction was given a boost in the final quarter by the drop in interest rates. In South Carolina, business and government construction had the stongest increase in building permits in 1984. Permits for apartments were up 42 percent, hotels and motels up 129 percent, stores up 24 percent, hospitals and institutions up 42 percent, and other government nonresidential buildings up 15 percent. In the South, existing single family home sales grew 3.9 percent, while the national increase was 5.5 percent.

The demand for housing has been building steadily as more and more people in the 25 to 34 age bracket seek to become homeowners. Consumer confidence was evident by many first-time homeowners who felt they could handle the risk of having more than 28 percent of their household monthly income going to make monthly mortgage payments. Consequently, adjustable rate mortgages (ARM) played an important role in making these purchases. Approximately 60 percent of all conventional mortgages during 1984 were based on ARM. With the prevalent use of adjustable rate mortgages, consumers are becoming more sensitive about how changes in interest rates affect their monthly budgets. It appears that there now exists a shorter lag between changes in the interest rate and home investment.

Commercial Banks

Banks and thrifts generally enjoyed a good year as a result of an increase in deposits and the general level of borrowing. With more of the labor force at work, commercial bank deposits rose, providing more loanable funds. In South Carolina, deposits in commercial banks increased by 9 percent by mid-year as compared to a 23 percent rise by the same time the previous year. Commercial banks increased substantially the volume of loans outstanding in 1984, aided by large business loans. Business loans in the first part of the year to finance corporate mergers and leverage buyouts were a significant factor in overall business loan growth. Despite a slowdown in business and real estate loans during the summer and fall months, consumer loans kept pace.

Savings and Loans

Savings and loan activity in South Carolina during 1984 was higher than in 1983. Total assets of savings institutions in the State rose 18 percent for the year

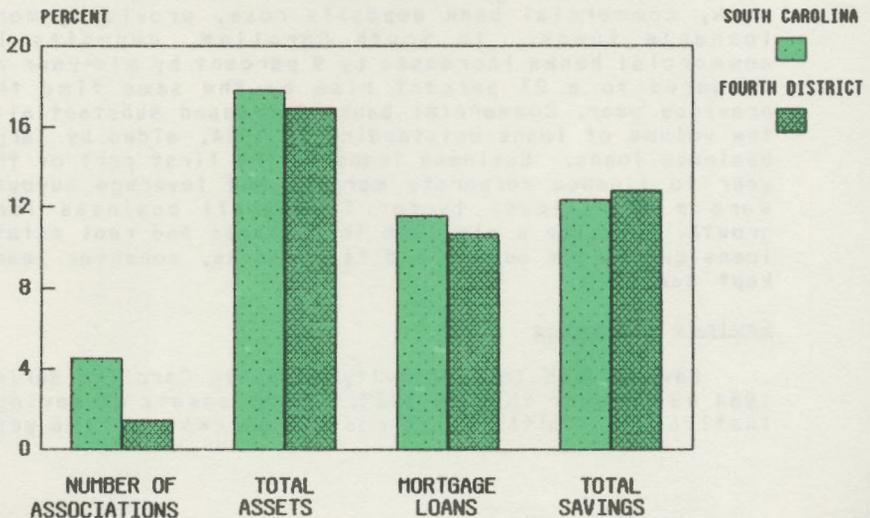

compared to 12 percent in 1983. Mortgage loans jumped 11.5 percent, more than twice the rate they increased the previous year. Total savings in the State grew 12 percent, keeping close pace with the Southern average. Several new thrifts opened in South Carolina and were well received. Their major advantage was their newness. They were able to offer competitive rates because they were not tied down by old low interest mortgages.

Credit Unions

Credit unions throughout the State also benefited from the economic growth and consumer confidence in 1984. From December 1983 to December 1984, membership in credit unions grew 9.8 percent, double the rate in either 1982 or 1983. Assets of credit unions grew 20 percent in 1984, and savings grew 19 percent. Loan activity increased 35 percent in 1984 compared to a rise of 22 percent for the previous year.

Outlook

With deregulation of the banking industry, interstate banking in one form or another continues to spread. Interstate banking occurs when a bank headquartered in one state moves across state lines to open deposit-taking offices or when a bank holding company crosses state lines to acquire an existing bank office. The McFadden Act of 1933 prohibits the former activity, while the Douglas Amendment to the Bank Holding Company Act restricts the latter by requiring the holding company to have the approval of the new state. Together, these two acts had prevented interstate banking from becoming a reality but changes in the economic and legal environment have brought about a new wave in banking.

Despite the legal restrictions to interstate banking, interstate banking has spread. By law, banks are defined as institutions that perform two activities: 1) accept demand deposits and 2) make commercial loans. By performing only one of these activities, such as accepting demand deposits, nonbanks escape the interstate banking regulations. These nonbanks can thereby cross state lines and offer financial services in competition with local banks. Bank failures have served to lessen the second requirement. State officials who have been eager to restore public confidence in state banks when one has failed are willing to allow an out-of-state bank to acquire the failed institution and restore operation.

Though many concerns over the effects of interstate banking on local banks have been raised, most evidence seems to indicate that interstate banking could have a positive impact on consumers and banking. For consumers an increase in potential competition will occur. More and more larger banks will have a larger supply of funds to offer. For smaller banks, size does not appear to have any particular cost advantage for the larger institutions. Technology, especially Automatic Teller Machines, allow smaller banks to reach more of the population without incurring the high overhead costs of opening branch offices that larger banks may be able to meet. The banker's banks have already appeared to help smaller banks by making available the kinds of resources that are available to larger banks. Overall, it seems that efficient management will continue to be the key to success in banking, for small and large banks alike.

To assure its participation in the new environment, South Carolina was one of four states in 1984 that passed reciprocal regional banking laws, which take effect January 1, 1986. The law does not cover branching into the State explicitly. Rather, it deals with the acquisition of existing banks. Out-of-State banks may acquire in-State banks that have been in existence for at least five years. This arrangement applies only for the regional states that have passed similar reciprocal agreements with South Carolina. These are Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Tennessee, Virginia, West Virginia, and the District of Columbia.

MANUFACTURING

UNIVERSITY OF TORONTO

MANUFACTURING

United States Industrial Production

In 1984 the manufacturing sector of the United States continued the recovery from the 1980-1982 recession. After a dismal showing of -8.5 percent change in 1982, United States industrial production grew 7.8 percent in 1983 and surged with a healthy 11.2 percent rate of growth in 1984.

The manufacturing sector as a whole performed well in 1984; however, there were distinct imbalances in industrial production growth among the various manufacturing sectors. Growth of production in the durable goods sector in 1984 was over twice that in the nondurable goods sector. Consequently, a dichotomy was evident between durable and nondurable goods in the nation in 1984.

There were several important developments which led to the strong showing of production of durable goods in 1984. First, accelerated purchases of durable goods were very much a function of pent-up demand. During the recessionary period of 1980-1982, consumers decided to postpone durable goods purchases.

Second, consumer action was triggered by the drop in interest rates in 1983. As interest rates fell from a 20 percent level to an 11 percent level, large ticket durable items normally purchased with installment credit became more affordable to the average consumer. As a result, all major categories of durable industrial production exhibited substantial growth in 1984.

Third, auto production was also helped by voluntary import quotas on foreign car shipments into the nation. Auto production rose 35 percent in 1984 over its 1983 level. Production in the stone, glass, clay, primary metals and fabricated metals sectors, suppliers of materials to the auto industry, also grew at healthy rates.

Another important development, particularly for South Carolina, was in nonelectrical machinery. In 1983, the federal excise tax on gasoline was raised five cents per gallon, accumulating billions of dollars for use in rebuilding the nation's roads and bridges. This program, plus improved tax incentives, helped to stimulate demand for nonelectrical machinery used in highway construction.

As was the case for auto sales, new housing starts were stimulated by pent-up demand and falling interest rates. From 1981 to 1984, national housing starts increased from 1.096 million units per year to 1.766 million units per year. This growth spurred greater production in lumber, furniture and stone, clay and glass. Housing starts growth also influenced the favorable growth in electrical machinery through the increased purchase of household appliances. Overall, durable goods production was robust in 1984 due to pent-up demand and falling interest rates.

Within the nondurable sector, most industries grew, except for textiles, whose industrial production was -1.6 percent. This negative growth rate was at least

partially a function of the rapid growth in imports. The poor showing of textiles also dampened the growth of its primary supplying industry, the chemical industry.

The one nondurable section performing well in 1984 was printing and publishing, which benefited from the general recovery of the economy because it supplies finished goods to all sectors of the economy, many of which were experiencing strong growth in 1984.

From a longer run outlook, even though the manufacturing sector as a whole has been decreasing in recent years in relative importance due to the growth in services, those manufacturing sectors producing goods necessary to deliver services should continue to show above average growth for the near future. The electrical and nonelectrical machinery categories which supply goods necessary for the delivery of fast-growing health services, communication services and business services may be the faster growing manufacturing categories in the years to come.

To summarize the national manufacturing sector, the level of manufacturing activity was heavily influenced by three basic factors. First, the pent-up demand of the recessionary period was released in 1984, and this led to a strong durable goods performance. An important part of this was the robust growth in traditional heavy durable sectors, such as autos and furniture. Second, the lowering of interest rates triggered a rise in consumer purchases of durable manufactured and construction goods. With large pent-up demand and the effective price of goods dropping because of lower interest rates, consumers purchased durable goods at accelerated levels. Third, was the structural change in the economy toward a services orientation. This development is extremely important because it may decrease sustainable, vigorous growth in the national manufacturing sector overall. However, the manufacturing sectors most closely associated with the services industries may provide the future growth in the national industrial base, whereas other manufacturing sectors may exhibit diminished long-term growth in the future.

South Carolina Manufacturing

South Carolina is heavily dependent on the manufacturing sector. Only North Carolina has a higher percentage of manufacturing employment to total

employment. National manufacturing trends are usually magnified on the State level. The rapid growth in national demand for durable goods and machinery had a most favorable impact on South Carolina. On the other hand, the continued increase in textile imports has caused the textile and related industries to exhibit poor growth, resulting in a significant negative impact on the State.

Employment

In general, 1984 was a good year for manufacturing in South Carolina and manufacturing employment. Total manufacturing employment grew 4.5 percent in the State. This growth rate was substantial considering the structural changes currently taking place in the manufacturing sector.

The year, 1984, was the first since 1979 that employment grew in the manufacturing sector. During the recessionary period, 1980-1982, manufacturing employment did not increase because there was a drop in the aggregate demand for manufactured goods. In 1983 many manufacturing companies depleted their inventories to meet higher demand rather than increase employment. In 1984 many companies in the State stepped up production and the recovery became evident in State manufacturing employment.

A major portion of the growth in the State is manufacturing employment in the durable sector. Growth of employment in the durable goods sector rebounded 10.3 percent in 1984 after four previous years of lackluster performance. Part of the upturn was attributable to lower interest rates which prompted more residential and nonresidential construction and capital investment. As a result, all the major categories of durables employment in the State with the exception of furniture employment showed sizeable gains in their respective employment levels.

The status of nondurable manufacturing employment was an improved one in 1984, but still not promising. Approximately 70 percent of all nondurables employees in the State were involved in the manufacture of some type of textile product. Thus, the structural changes of the textile industry have had a profound impact on the nondurable sector.

The paper products, printing and publishing sectors, and that part of chemicals not associated with textile synthetics, weathered the recession of the early 1980 period. Thus, employment growth in 1984 in these areas was a continuation of the overall historical trends of growth. Likewise, the overall trends in the textile and related sectors dictated their 1984 movement in employment. Textile mill employment lost only 600 jobs from 1983 to 1984 and apparel gained 2,500 jobs over the same period. Likewise, the part of chemicals associated with textile manufacture lost only 700 employees in 1984. These figures show a relatively constant year-to-year level of employment in the industry, but the overall historical trend is much more bleak. In 1973, total textile and related employment reached a peak of 224.2 thousand employees; by 1984 that figure dwindled to 179.7 thousand employees. Also, until 1984, textile and related employment decreased every year since 1977. As a result, whatever gains that have been made in recent years in non-textile

manufacturing categories have been negated by the loss of jobs in textile and related industries. Hence, recent history displays the textile verses non-textile dichotomy evident in the State's manufacturing sector.

UNITED STATES TEXTILE AND APPAREL TRADE
 IMPORT AND EXPORT VALUES
 1975 - 1984

SOURCE: US TEXTILE MANUFACTURERS ASSOCIATION

Many blame the dramatic rise in textile imports for the decline in textile employment, and there is little doubt that it has had a profound impact on employment levels. From 1975 to 1984, textile and apparel imports have increased 365.8 percent, while exports have increased 57.2 percent. This has led to burgeoning trade deficit in textiles and apparel with the rest of the world.

The growth of the trade deficit shows in the total amount of textile shipments from plants located throughout the nation. From 1975 to 1984, total textile shipments in the United States grew 78 percent in nominal terms, but when adjusted for inflation, the rate of growth was only 40 percent. This translates into a real average annual growth rate of 3.8 percent per year. With this modest growth rate and the development of labor saving technologies, less labor has been needed to produce textile products. This is the dilemma that the State's largest manufacturing category faces. In order to compete with the influx of imported goods, the State's textile and related industry must continue its modernization for higher productivity. In a decreasing

Table 4

market for domestically produced goods, this means not only less labor input per unit of output but also less labor. Consequently, the textile and related industry has not made a positive contribution to the State's manufacturing employment levels and is not expected to do so.

Textiles manufacturers have sought relief from the flood of imports from the Administration and the Congress. The Administration has entered into the Multi-Fiber Arrangements (MFA) with Japan and certain developing countries to stem the flow of imports. However, the MFA, thus far has not been sufficiently restrictive to reduce imports since the MFA does not include many countries. Legislation has been introduced in the Congress, with considerable support, that would be much more restrictive than the current MFA. Although its passage is uncertain, lobbyists for textile manufacturers are hopeful that this legislation, or a similar version will be passed in this Congress and provide meaningful relief to the industry. The MFA comes up for renewal in July 1986, at which time textile manufacturers hope to press for more meaningful restrictions under the arrangement, if legislation is not enacted by then.

State Manufacturing Work Conditions

South Carolina manufacturing workweek statistics show an economy in the second stage of recovery from the recession. In 1983, manufacturing was stepped up over the previous year by increasing the average workweek. In 1984 more employees were added. Consequently, the 1984 State statistics for the average manufacturing workweek, average weekly earnings and average hourly earnings display a decelerated growth.

Average manufacturing workweek in 1983 increased for all categories, but the growth in 1984 was more uneven. All durable goods categories increased in 1984 with the exception of stone, clay and glass products. However, the overall average manufacturing workweek for nondurable goods decreased from 40.4 hours to 40.3 hours. The nondurable categories hardest hit were the textile and related categories. Two categories, stone, clay, and glass products and nonelectrical machinery, averaged over 42 hours per week for the year. These higher figures were partially in response to the increase in construction and auto production in 1984.

Average hourly earnings in the State's manufacturing sector increased 3.6 percent in 1984. This growth was not as substantial as the 5.2 percent from the previous year, and when the 4.3 percent inflation rate experienced in 1984 is taken into account, the increase looked small indeed. Those categories receiving the highest hourly wages were chemicals and paper products. The lowest hourly wages paid to workers in 1984 was in the apparel category.

Manufacturing average weekly earnings for 1984 grew 4.1 percent, considerably less than the 1983 figure of 11.8 percent. Gains in most categories were

Table 5

substantial, but not robust. Leading the growth were the durable manufacturers of lumber, furniture, nonelectrical machinery, electrical equipment and instruments. The differential between durable and nondurable average weekly earnings was only \$13.43 in 1984. However, this small differential is misleading because the nondurable categories of paper and chemicals were approximately 50 percent higher than the manufacturing average weekly earnings figure of \$297.07. Thus, on average, manufacturing workers in the durable sector earn significantly higher wages than those in the nondurable sector.

Summary

The manufacturing industries of the U.S. and South Carolina overall were favorably impacted in 1984 by the enormous investment undertaken by business and the surge in purchases of durable goods by consumers.

The manufacturing sector on a national and State basis was also affected but negatively by the continued development of the services industries. A larger share of the marginal dollar earned by an American consumer was spent on services. Thus, growth of employment in 1984 in the manufacturing sector did not match the service sector.

The tremendous influx of textile imports has drastically changed the structure of South Carolina's manufacturing base. As a result, manufacturing growth in South Carolina in 1984 was in the non-textile durable sector, and this trend is expected to continue in the future.

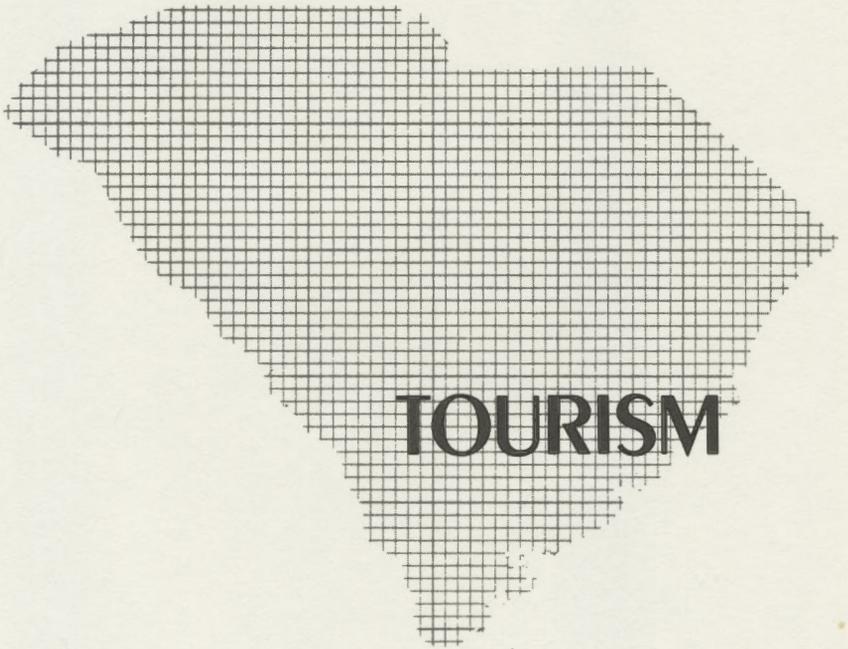

The experience of 1984 may be a good indicator for the future of national and State manufacturing trends with growth in the manufacturing sector lower than the average for the entire economy.

Industry	1984	1983	1982	1981	1980

Table 1. Manufacturing Industry Output, 1980-1984

The manufacturing industry of the U.S. and South Carolina generally have been only loosely related in the economic development patterns of the past and the range in patterns of durable goods of consumers.

The manufacturing sector in a national and State basis was also affected by changes in the composition of the national industry. A large share of the national total output of manufacturing was spent on durable goods. This shift in investment in 1984 in the manufacturing sector was not which was

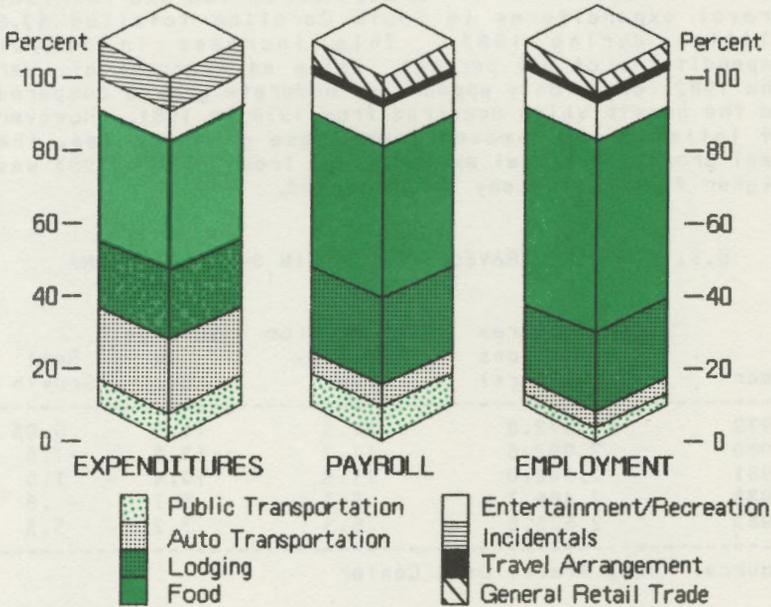

TOURISM

WESTBURY

TOURISM

The South Carolina economy is heavily dependent upon tourism and travel activities. Even during periods of recession, when the manufacturing and construction sectors suffered extensively, the tourism sector of the State generated employment, income and revenues. During the last two years of economic recovery, the tourism industry flourished and had a favorable impact on the State's economy. Production, employment and disposable income have risen and consumers have reacted enthusiastically in planning their vacations. Comparable statistics for travel are not yet available for 1984, but data on hotel and restaurant sales from sales tax collections indicate that 1984 was a banner year for tourism. In 1984, hotel and restaurant sales were up 19 percent over 1983.

DISTRIBUTION OF SOUTH CAROLINA TRAVEL-RELATED INDUSTRIAL GROWTH IN 1983

Source: United States Travel Data Center

Latest available data on travel indicate that 1983 was also a good year for tourism. Over four million people traveled throughout the State during calendar year 1983, a 7 percent increase over 1982. Tourists and travelers in the State spent nearly \$2.6 billion during 1983, an increase of 6.5 percent over 1982. According to the South Carolina Department of Parks, Recreation and Tourism, these tourism expenditures generated over 69,300 jobs with an annual payroll of \$508 million. Federal, State and local tax revenues generated from this increase in tourism amounted to \$225.8 million in 1983. Continued rapid growth of the leisure industry of the State is predicted throughout the 1980's as the economy improves and as newly-constructed facilities accommodate further growth.

Travel-Generated Expenditures

As the recovery continued, price increases moderated which meant that the costs to travelers for expenditures on transportation, lodging, food, entertainment, recreation and incidentals during 1983 were not rising at the double digit paces which occurred from 1979 to 1981. According to estimates of the South Carolina Department of Parks, Recreation and Tourism, travel expenditures in South Carolina totalled \$2.6 billion during 1983. This increase in travel expenditures of 6.5 percent, while an improvement over the 1982 level, only appears as moderate growth compared to the growth which occurred from 1979 to 1981. However if inflation is removed from these growth rates, the real growth in travel expenditures from 1982 to 1983 was higher than during any other period.

Table 1
U.S. RESIDENT TRAVEL SPENDING IN SOUTH CAROLINA
1979-1983

Year	Expenditures (in Millions of Dollars)	%Change From Previous Year	%Change In CPI	Real Growth
1979	\$1,872.8	11.3	11.3	0.0%
1980	2,092.6	11.7	13.5	-1.8
1981	2,342.0	11.9	10.4	1.5
1982	2,466.7	5.3	6.1	-.8
1983	2,626.8	6.5	3.2	3.3

Source: U.S. Travel Data Center

The largest travel expenditure items are food, auto transportation and lodging which accounted for 35.2 percent, 20.5 percent, and 19.4 percent respectively of the total expenditure dollar. The increase in the cost of food was only 2.1 percent, as measured by the food component of the Consumer Price Index. Likewise the increases in the cost of auto transportation and lodging as measured by the respective components of the Consumer Price Index were only 2.2 percent and 2.7 percent. The main costs of travel, therefore, increased less than the general rate of inflation in 1983.

Table 2
U.S. RESIDENT TRAVEL SPENDING IN SOUTH CAROLINA
BY CATEGORY, 1983

Expenditure Category	Expenditures (\$ millions)	Percent of State Total

Travel-Generated Payroll

The U. S. Travel Data Center estimated for the S.C. Department of Parks, Recreation and Tourism that, on average, every dollar of travel expenditure in South Carolina produced 19 cents in payroll income during 1983. Travel-generated payroll in South Carolina totalled \$508 million in 1983, an increase of 5.9 percent or \$28 million over the 1982 level.

Travel-Generated Employment

Even during periods of recession when the unemployment rate in the State reached into double digits, the tourism and travel-related industries have provided employment opportunities throughout the State. Due to the diversity of spending on travel and tourism, a wide variety of jobs at various skill levels have been

created. On the average, every \$37,925 spent by travelers in South Carolina directly supported one job during 1983.

Table 3
TRAVEL-GENERATED PAYROLL IN SOUTH CAROLINA
BY CATEGORY, 1983

Industry Category	Payroll (\$ millions)	Percent of State Total
Public Transportation	\$ 48.1	9.5%
Auto Transportation	32.3	6.4
Lodging	118.1	23.2

Travel-Generated Tax Revenue

Travel and tourism expenditures generate tax revenue for all levels of government, helping to finance public services enjoyed by all South Carolina residents. The State government receives the largest amount of travel-generated revenue from State income, sales and excise taxes, as seen in Table 5. Sources for travel-generated tax revenue to the Federal government include excise taxes on gasoline, airline tickets and personal and corporate income. Local governments receive travel-generated revenue from sales and property taxes. Although sector statistics regarding taxes specifically generated by travel and tourism are not yet available for 1984, the amount of revenues for local governments will increase substantially beginning July 1984 since the sales tax for hotels was raised 2 cents per dollar to provide funds for local districts.

State	121.4	5.7
Local	13.7	1.9
Overall	\$225.8	3.0%

Source: U.S. Travel Data Center

Summary

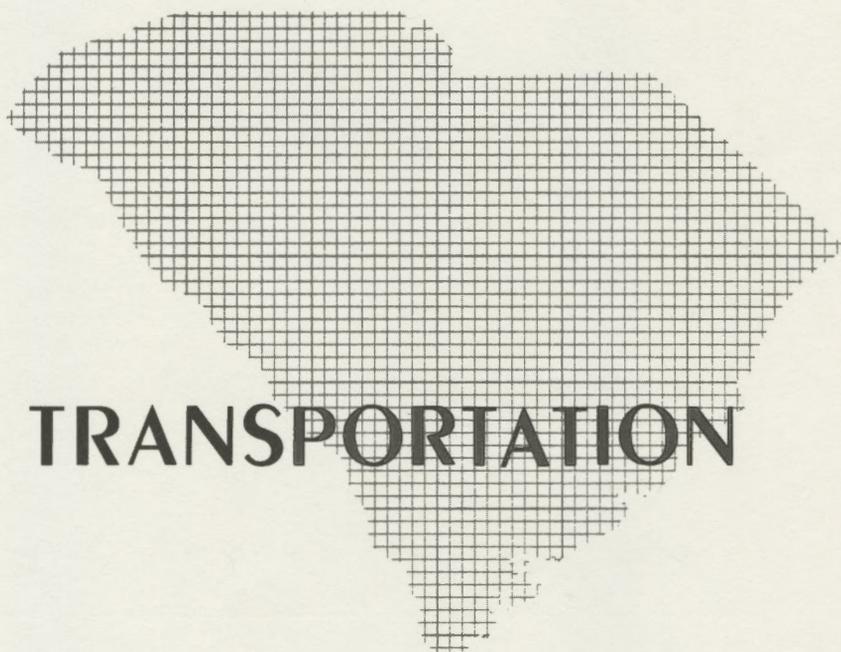

Growth of tourist-related industries plays a key role in the State's economic outlook. Economic growth in tourist-related activities is expected to remain robust, generating revenue, personal income and employment opportunities throughout the State.

TRANSPORTATION

TRANSPORTATION

An efficient transportation system is vital to South Carolina's economy, particularly as the economy matures and develops service-type industries. A smoothly integrated system is essential to a progressive economy, not only as a locational factor for developing industries, but as a conveyor of goods and services of existing industries. The major industries in South Carolina, particularly manufacturing, tourism and agriculture, rely heavily upon the transportation system in the State and its ability to accommodate an ever changing commercial market. The demands of this market continued to rise during 1984 resulting in an upswing in port activity, air traffic and the usage of the Interstate system.

HIGHWAYS

A well planned, constructed and maintained highway system is the foundation for an economy's transportation network. In fiscal year 1984 South Carolina's highway system consisted of 39,991 miles, an increase of 167 miles since fiscal year 1983. The State Secondary System accounts for nearly 75 percent of the total highway system or 29,847 miles, while the State Primary System consists of 9,388 miles and the Interstate System consists of 756 miles, or less than 2 percent of the total highway system.

The South Carolina Department of Highways and Public Transportation has responsibility for the planning, construction, and maintenance of the State highway system, the administration of all motor vehicles, driver regulation and related laws, the enforcement of the State's traffic laws throughout the highway system and coordination of public transportation in the State.

In fiscal year 1984, South Carolina Department of Highways and Public Transportation revenues and other receipts exceeded expenditures by \$31.7 million, which was a 23.7 percent increase from fiscal year 1983. Total revenues grew over \$63 million, or 12.1 percent in 1984. Revenue from motor fuel and road use taxes in fiscal year 1984 increased 7.0 percent over fiscal year 1983. This increase was primarily due to a large 5.1 percent increase in motor fuel consumption, from 1.7 billion gallons in fiscal year 1983 to 1.79 billion

gallons in fiscal year 1984. This large increase in gasoline consumption was partly due to the expanded tourism and recreation business of the State in 1984. Although statistics for miles traveled in South Carolina are not yet available, figures for interstate highways in the East indicate that long distance traveling was up just under five percent. Approximately 56 percent of the highway dollar came from the motor fuel tax. Motor fuel taxes and license fees accounted for 67.9 percent of total highway revenues. Grants-in-aid and miscellaneous receipts account for the remaining 32.1 percent of total revenues.

Expenditures by the Department rose \$63 million, or 12.1 percent in 1984. The largest expenditure category, accounting for 52 percent of the total, was highway construction. Expenditures on highway construction increased \$39.0 million, or 25.7 percent during fiscal year 1984. Highway maintenance, which accounted for 27 percent of the total, increased 6.2 percent. The average regular maintenance cost per mile for interstate roads was \$5,772, for primary roads, \$2,365, for secondary roads, \$1,422 and for all other roads, \$1,727.

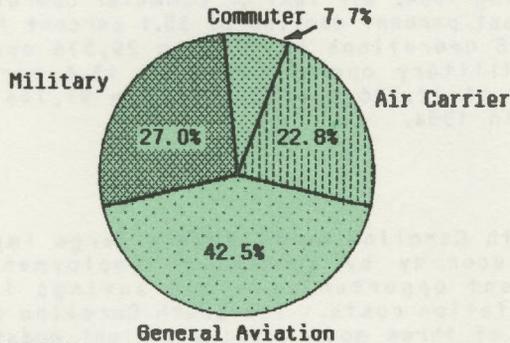

AIRPORTS

A healthy and well-maintained system of airports is vital to the economic well-being of South Carolina. Adequate aviation facilities are high on the list of requirements for industrialists and businessmen searching for new plant and business sites. The South Carolina Aeronautics Commission has an ongoing program of airport development and improvements, and the stated goal of having at least one paved, lighted airport in each county of the State. Presently, South Carolina has airport facilities in 45 of its 46 counties. Cherokee County is the only exception, and construction plans for a runway are currently underway.

In 1984, air transportation activity in South Carolina declined largely because of fewer general aviation operations. Statistics from five airports having a Federal Aviation Administration Control Tower showed 385,784 operations (take offs and landings) during 1984, a decline of 3.7 percent, or 14,697 operations from 1983. These five airports are located in Columbia, Charleston, Greenville, Florence, and Myrtle Beach.

All aircraft operations in the State can be categorized as general aviation, major airline carriers, commuter airline or military operations. The largest segment of air transportation in the State is general aviation. General aviation is defined as aviation which is not scheduled commercial service or military flying. It embraces a wide variety of civil flying activities, from private, pleasure flights to corporate trips and crop dusting. During 1984, general aviation aircraft operations declined 25.9 percent from 221,106 to 163,992 operations.

Total Operations	400,481	385,784	-14,697	-3.7

Source: South Carolina Aeronautics Commission

In contrast scheduled air carrier operations more than doubled in growth during 1984, increasing from 41,991 to 88,134 operations. Piedmont along with United, Delta, Eastern, and New York Air continue to provide service to the five major population centers of Columbia, Greenville-Spartanburg, Charleston, and Myrtle Beach. Air carrier operations recorded at those airports during 1984 were 88,134, an increase of 46,143 operations from 1983.

The Airline Deregulation Act of 1978 made it much easier for air carriers to enter new markets. Since passage of the Act, there has been a noticeable shift nationwide by the carriers out of older, unprofitable markets.

During 1984, air taxi or commuter operations showed the largest percent decline of 35.1 percent from a level of 45,538 operations in 1983 to 29,576 operations in 1984. Military operations grew 13.4 percent or an increase of 12,336 operations from 91,746 in 1983 to 104,082 in 1984.

PORTS

South Carolina ports have a large impact on the State's economy by generating employment, income, investment opportunities and savings in overland transportation costs. The South Carolina port system consists of three modern and efficient coastline ports, Charleston, Georgetown and Port Royal, and an inland jet port, Greenville-Spartanburg Airport. Currently containerized cargo accounts for 75 percent of general cargoes moving through the Port of Charleston. Projections from the South Carolina State Ports Authority indicate that containerized cargo will account for 85 percent of general cargoes in the near future. Through 1984, South Carolina has invested more than \$181 million in port facilities. Current replacement value is estimated at \$411 million. Return on investment to South Carolina taxpayers is estimated to be \$21 million per year in the form of port-induced State taxes. This return is equivalent to more than three dollars every year for every one dollar of cost to the State for developing port facilities. Some 2,000 South Carolina enterprises use the State ports regularly. These firms generate an estimated 30 percent of South Carolina's total personal income.

South Carolina ports provided excellent service to shippers during the year. Containerized cargoes have grown at an accelerated rate since 1970, reaching 2.78 million tons in fiscal year 1984. The hub of South Carolina's port activities is the port of Charleston, which lives up to its name as the "Service Port of the South" by efficiently handling more than 412,000 TEU containers (Twenty-foot Equivalent Units) per year. The Port of Charleston is currently the seventh-ranked container port in the continental U.S. and the first-ranked Sunbelt container Port Load Center of the Southeast. Total general cargo trade through South Carolina ports is about 40 percent with Europe, 37 percent with the Far East and 23 percent with the remainder of the world. About 60 percent of this trade originates or terminates in South Carolina. In addition the Port of Charleston regularly handles cargo for 27 states, with special concentration of cargo to and from Georgia, North Carolina, Tennessee and the Midwest. State Ports Authority's general cargo trade through Charleston is about 60 percent export and 40 percent import. Sixty-two percent of container tonnage is export and 58 percent of the total tonnage at all State Ports Authority ports is export. This represents a major swing since 1973, when the port moved away from a dependence on imports. Prior to that time, about 70 percent of Charleston's cargo was import.

South Carolina's leading exports are textiles, fibers, chemicals, paper products, grain, forest products, woodpulp, clay and clay products, heavy equipment and machinery. Major imports include semifinished textile goods, iron and steel products, bananas, metallic ores, petroleum, plywood and veneers and a variety of consumer goods.

Charleston and Georgetown have become major ports of entry for imported hardwood products from the Far East, Africa and South America. Most of these products are destined for plywood and veneer processors in South Carolina and to furniture manufacturers in Georgia, South Carolina and North Carolina.

Major new export opportunities have opened up recently for South Carolina. One of these is southern pine lumber. South Carolina producers are actively engaged in this business at present with good prospects for future growth. Additionally, important markets for South Carolina-manufactured textile machinery are available in Brazil.

The agricultural sector of the State depends heavily upon port facilities. Twenty-nine percent of the total value of South Carolina's agricultural production is exported, primarily through State port facilities. Almost every agricultural crop and food product that grows in South Carolina has an overseas market.

Port operations are supported on land and sea. The Port of Charleston is served by two major railroads, Norfolk-Southern Railway Corporation and the Seaboard/Chessie System Railroads, and by 94 motor lines. Rail line traffic involves approximately 55,000 rail container and 14,500 box car movements per year, while truck movements average about 1,300 trucks each working day.

The total profile of ocean service covers some 56 foreign countries. More than 1,669 ships representing 50 steamship companies called at Charleston in 1984. These include 121 tankers and dry bulk carriers which berth at private terminals.

South Carolina port operations are supported by 16 cargo and marine surveyors, 12 ship suppliers, seven dredging companies, 37 broker/forwarder businesses, 22 steamship agents, 15 stevedoring contractors, seven tugboat operators, 17 general cargo warehousing companies, 24 container leasing and/or repair depot operations and seven foreign consular representatives. This support aids the port system in meeting the demands of a total profile of ocean service covering some 56 foreign countries.

In May of 1982, the Wando Container Terminal was opened with three new containership berths and four special container cranes. The Wando location offers potential for meeting future demand for port services into the 1990's. During the 1983-84 fiscal year, 136,732 TEU's were handled at the Wando Terminal. It is expected to have a high economic impact on the South Carolina economy as well as beneficial operational impact on the port.

ORION, a computerized shipping processing system, has been developed by the State Ports Authority. It links the Ports Authority data base to those of the United States Customs Service, the United States Department of Agriculture, steamship lines and agencies, and brokers and forwarders. This 24-hour, on-line system

keeps track of shipments and expedites all cargoes through the ports in record time. Breakbulk cargo clearances, which used to require several days in some cases, are now accomplished within 48 hours. Ninety-eight percent of all containers arriving at the ports now are cleared for shipment within a couple of hours of arrival.

The International Transport Center, which was dedicated November 9, 1983, is located on South Carolina Highway 290 near Greenville-Spartanburg Airport and Interstate 85, which readily connects to six other Interstates. The International Transport Center facilitates interchange activities inbound and outbound and prevents costly hauling of empty containers over the distance between the International Transport Center and the Port of Charleston. Area plans include marshalling and distribution capabilities. A large warehouse, a rail yard and a privately-operated cold storage facility are already constructed.

During 1984, several major physical changes and additions were accomplished at Charleston's terminals:

At North Charleston Terminal, expansion projects included removal of some warehousing facilities and lumber sheds to create an additional 25-acre container back-up area adjacent to Berth 1, plus the addition of its fourth container crane and a transtainer.

At Columbus Street Terminal, new projects of recent months include the construction of a main access gate on Johnson Street at the north end of the terminal. It directly connects truck traffic with the intersection of I-26 and U.S. 17 and provides multi-lane access in and out of the terminal. A new office and Receiving and Delivery building also have been completed at the terminal and a transtainer purchased.

At the Wando Terminal, construction has begun on a 40-acre tract behind Berth 3 for additional container parking. Extension of the pier and construction of a second 200,000-square-foot container freight station are also planned there.

**GENERAL
FUND REVENUES**

TOTAL GENERAL FUND REVENUES

The General Fund is the State's largest source of funding for State activities. It is a composite of revenue sources derived from taxation of income and sales and from licenses and fees. Also included in this fund are all institutional and departmental revenues or collections, including income from the sale of commodities and services.

The various revenues making up the General Fund are now categorized into two sources for accounting purposes in the fiscal State budget: Regular Sources and Miscellaneous Sources. Prior to Fiscal year 1981-82, an additional category was provided for Federal Revenue Sharing which has since been discontinued.

Regular Sources

Regular Sources are comprised of those revenues which are established bases of revenue income from year to year. They are the Sales and Use Tax, Income Taxes (Individual and Corporation) and an All Other segment encompassing all Regular Source revenues other than Sales and Income.

Miscellaneous Sources

Miscellaneous Sources consist of additional revenues that are not as predictable as collections from Regular Sources. Generally, this classification incorporates among others: 1) those receipts which do not always continue in succeeding years, often labeled as "nonrecurring" revenues, 2) first-year collections of newly enacted taxes and 3) line-item transfers of either agency appropriations or other funds to the General Fund for specific purposes. Due to constant shifts in revenue items from year to year, this category has no actual trend to monitor and no analysis is presented in the text.

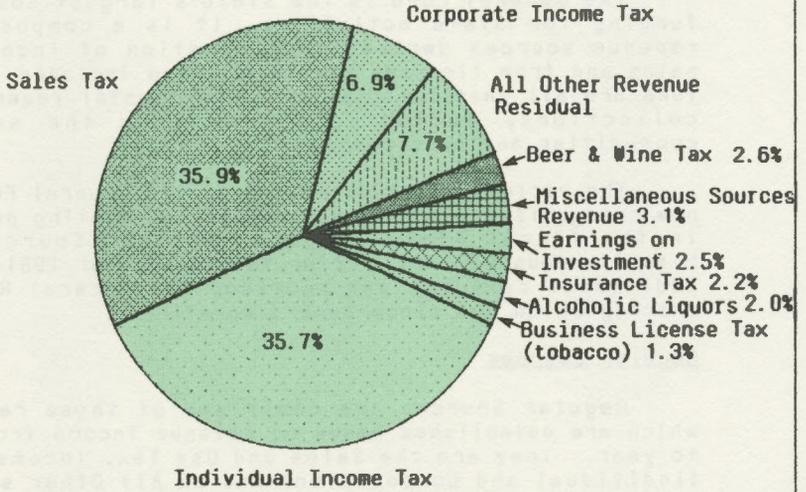

Fiscal Year 1983-84

The economic surge that began in 1983 and carried over into 1984 clearly had a significantly favorable impact on revenue collections by the State in Fiscal Year 1983-84. Collections for the General Fund totalled \$2.228 billion, an increase of \$258.3 million, or 13.1 percent over the \$1.970 billion collected in Fiscal Year 1982-83.

Collection of corporate income taxes was the best growing source of revenue, rising 24.5 percent to \$154.4 million. This amount was the highest corporate tax revenue ever collected by the State. Corporate income taxes are collected from all corporations doing business in South Carolina on the basis of the percentages of the corporation's assets, wages and salaries, and sales attributable to the State. Business activity picked up considerably in the State during the fiscal year, accounting for a significant portion of the increase in corporate tax collections. The State also benefited from the generally improved health and profits of corporations nationwide by receiving its proportionate share of corporation's profits.

Personal income taxes rose 10.7 percent, which was less than the rate of increase in corporate taxes, but still a healthy increase compared to the 7.9 percent increase in personal income in the State during Fiscal Year 1982-83. Though businesses began to increase output in 1983 and had higher profits, they did not increase employment to the same extent. Businesses in general used excess productive capacity remaining from the recession to expand output. Indeed, the number of nonagricultural workers in the State rose only 2.2 percent in 1983. As output continued to increase in 1984 and some of the excess capacity was utilized, business increased employment. Nonagricultural employment rose 6.9 percent in 1984 over 1983. However, a large part of this increase in income from higher employment did not impact income tax receipts until Fiscal Year 1984-85, which began in July 1984.

The sales tax was the largest source of revenue for the State in Fiscal Year 1983-84. Sales taxes rose an extraordinary 15.5 percent over the previous fiscal year, even though the rate of inflation fell to 3.6 percent. This growth was significantly more than the growth in both personal income and personal income tax collections. Improved consumer psychology and spending to satisfy pent-up demand for durable goods were significant factors in the increase in sales tax collections. Consumers borrowed heavily to finance additional purchases, accounting for the larger increase in sales taxes over growth in personal income. Sales taxes were also bolstered by the recovery of South Carolina's travel and tourism industry which attracted income from out-of-State visitors. Overall, sales taxes rose a hefty \$107.3 million and accounted for 42 percent of the total \$154.4 million increase in total revenues for the General Fund.

Collections from other sources, which include bank income and insurance premium taxes, alcoholic and other excise taxes, plus various privilege fees, rose 8.6 percent. Although the increase in these revenues was less than the increase for income and sales taxes, the increase was relatively high compared to previous years and reflected the overall economic improvement in the State.

Fiscal Year 1984-85

By the beginning of Fiscal Year 1984-85, growth in the economy both nationwide and in South Carolina began to show signs of slowing. Consequently, the rate of growth in revenue collections began to fall. Moreover, significant changes in sales and income taxes also helped to reduce revenue growth. Overall, revenue for the General Fund grew less than 7 percent in Fiscal Year 1984-85 based on collections through June 30, 1985, down from 13 percent the previous full fiscal year. There may be additional modest revenues collected after June 30, 1985 as the accounting period for revenue accrued in Fiscal Year 1984-85 but not yet transferred to the General Fund.

In Fiscal Year 1984-85, revenue from the personal income tax was the largest source of revenue for the State, amounting to \$838 million. Personal income taxes grew 5.4 percent, which was less than the projected rate of growth for total personal income tax. Growth in income taxes was reduced by an estimated loss of \$32 million due to a special tax credit for tax year 1984 of \$12.50 per person for food costs. Income taxes were also reduced by another estimated \$4 million due to the indexation of tax brackets and the personal exemption to one-fourth the rate of inflation in tax year 1984.

Effective August 1984, the rate for the sales tax was raised from 4 cents per dollar to 5 cents per dollar. In order to remain competitive with bordering States, a limit of \$300 was placed on the tax that could be collected from the sales of autos, other motor vehicles, boats, airplanes, and mobile homes. Also an extra two cents per dollar was added to the sales tax for hotel accommodations to finance local tourism programs. The extra one penny of sales taxes was specifically earmarked for the Education Improvement Trust Fund, with none allocated to the General Fund. The extra two cents tax on hotel accommodations was earmarked for local districts and none was allocated to the General Fund.

Sales taxes rose an estimated 3.2 percent in Fiscal Year 1984-85, which was down from the 15.5 percent increase the previous fiscal year. Changes in the tax laws, a concentration of consumer purchases of durable goods subject to the \$300 limit, and a general slowing of consumer buying accounted for the decline in sales tax collections.

Corporate tax collections continued to grow at a phenomenal rate in Fiscal Year 1984-85, 24.4 percent. Though the rate of growth in corporate profits declined nationwide, tax collections held up in part due to the exhausting of tax loss carryovers accrued during the recession, a slowdown in the use of the investment tax credit and fewer writeoffs of obsolete assets.

Collections of all other taxes and fees increased in Fiscal Year 1984-85 by 7.7 percent, down from 8.6 percent the previous fiscal year. Bank income and insurance premium revenues exceeded expectations due to the improved conditions in the financial sector.
